Posh Raj Panday, national consultant for Nepal under the South Asia Subregional Economic Cooperation (SASEC) Trade Facilitation Program, prepared the diagnostic report, supported by the Asian Development Bank (ADB). The report was designed jointly by the Trade and Investment Division of the United Nations Economic and Social Commission for Asia and the Pacific, and ADB, which also serves as the SASEC Secretariat. Kshitiz Dahal, researcher at South Asia Watch on Trade, Economics and Environment, provided support in data analysis and conducted survey works.

Manoj Acharya, under-secretary, Ministry of Commerce, Government of Nepal, and convener of the Core Group for the SASEC SPS-TBT Diagnostic Study in Nepal, provided valued feedback and helped organize consultation meetings with the Core Group. Core Group members Mohan Kr. Maharjan, senior food research officer, Department of Food Technology and Quality Control, Nepal, and Sanjeev Kumar Thakur, director, Nepal Bureau of Standards and Metrology, also provided valuable insights. Additional Core Group members offered important suggestions during consultation and validation meetings. Support from the Ministry of Commerce to facilitate the study and organize the national validation meeting, which resulted in important feedback and recommendations for the study, is also gratefully acknowledged. Shyam Dahal, national trade facilitation consultant, ADB, also gave suggestions and helped organize the national validation meeting.

The study benefited from consultations with Anup Kumar Shrestha, assistant director, Federation of Nepalese Chambers of Commerce and Industry. Crucial insights were received through rich interactions with various commodity associations and exporting firms in Nepal.

Last but not the least, the support and guidance of Rose McKenzie, senior regional cooperation specialist, ADB; and Selim Raihan, Professor of Economics, University of Dhaka, Bangladesh and executive director, South Asian Network on Economic Modeling is appreciatively acknowledged.

Executive Summary

The South Asia Subregional Economic Cooperation (SASEC) partnership brings together Bangladesh, Bhutan, India, Maldives, Nepal, and Sri Lanka to promote regional prosperity by deepening regional integration, enhancing cross-border connectivity, and stimulating trade. However, intra-SASEC trade has not witnessed significant headway since the inception of SASEC in 2001. Among many reasons for weak intraregional trade, trade barriers erected by nontariff measures (NTMs) are believed to play a crucial role. A special set of nontariff measures—sanitary and phytosanitary (SPS) measures and technical barriers to trade (TBT)—present an interesting dilemma to exporters as well as policy makers. The same NTMs may be used to pursue both legitimate and protectionist goals: the boundary between these different motivations is very thin. The trade effects of such NTMs depend on the reasons behind their adoption and design. For example, if NTMs are used to correct market failure such as information asymmetry, trade may be enhanced as consumer confidence in the product will increase demand for it. If the NTMs are employed with the intent to protect domestic producers, however, they are likely to reduce trade. In either of these situations, such measures have been found to be a major export impediment for least developed countries (LDCs)—and Nepal is no exception.

Although Nepal does an overwhelming amount of trade with India, Nepal's trade with other SASEC countries has been negligible over the years, most especially in export. Although exports to SASEC countries comprise a significant portion of Nepal's global exports, the figures are unimpressive if India is excluded. Moreover, Nepal's exports to all SASEC countries exhibit either a steep decline or stagnation at an insignificant level. Finally, except for India, Nepal's exports to other SASEC countries comprise only a few products.

Against this background of Nepal's weak exports to other SASEC countries, with the exception of India, and proliferating use of SPS measures and TBT worldwide, the aim of this report is to identify the critical SPS and TBT constraints faced by exporters, with the conviction that mitigating these constraints will create a conducive atmosphere for the exports of many products that are currently not being exported (or exported at a very low level) to SASEC countries.

The first part of this national diagnostic study involves identifying items that could be exported from Nepal, yet which would be subject to SPS measures and TBT in importing SASEC countries. To identify these potential export products, this diagnostic study looks at trade data for the years 2010–2014 to identify commodities that Nepal has been exporting at a significant level, but not at all (or at a very insignificant level) to one or more of the SASEC countries. It ascertains that these products could be supplied to one or more SASEC countries at a price cheaper than what has been paid to importers and also that there is a

substantial import demand for these products. Around 100 potential export products for each SASEC country have been identified using this methodology.

The next critical part of this report is to identify the SPS- and/or TBT-related issues that might be impeding Nepal's export to the identified SASEC market. First, the overall regulatory system of SPS measures and TBT in Nepal is examined, and an attempt is made to identify the gaps in current SPS- and TBT-related legislations and regulations in relation to international practice. Institutional deficiencies, infrastructural constraints, and procedural obstacles related to SPS measures and TBT arising in Nepal are also noted. The report has identified gaps in both SPS- and TBT-related standards and major deviations from international practice such as lack of traceability; lack of hazard analysis and critical control points (or HACCP); primitive labelling and packaging rules; lack of mandatory basic standards; and lack of regulations regarding dangerous chemicals, pesticides, biocides, persistent organic pollutants, hazardous waste, and others. The infrastructure constraints in Nepal are especially severe given the insufficiency of adequate testing and calibration laboratories and the lack of accreditation for several key parameters. Institutional gaps such as outdated legislations and lack of human resources also create major constraints. Furthermore, procedural obstacles are seen to cause major problems to exporters.

Finally, the report determines existing gaps in standards and regulations, SPS measures and TBT, and related procedures that are likely to impede potential exports. It discusses some leading differences in standards and regulations and other SPS measures and TBT between Nepal and the other SASEC countries for the potential export products identified.

Through a survey of 29 exporting firms and commodity associations, the report also attempts to identify the major SPS and TBT issues, procedural obstacles, and other reasons for not exporting to SASEC countries. The survey uncovered major SPS- and TBT-related procedural obstacles for India: extremely strict testing requirements, arbitrariness of behavior, informal payments, and inconsistent classification of products. The report also identifies similar procedural obstacles for Sri Lanka and Bangladesh through other studies. No major SPS and TBT issues for Bhutan and Maldives are identified due to lack of related information for these countries and the inability to identify exporters to these countries as a result of insignificant trade relations.

The report also lays out the following prioritized practical recommendations for the public and private sectors in the areas of legislative and regulatory framework environment, institutional frameworks, and SPS- and TBT-related infrastructure status and gaps.

- (i) Upgrade the existing public laboratories to ensure that testing requirements are duly met and certifications issued by them are internationally accepted, and create a conducive environment for establishing new private or public-private laboratories to ensure that testing requirements for all the urgent parameters throughout the country are met efficiently.
- (ii) Conclude mutual recognition agreements, especially for priority perishable items, to counter excessive problems created by inspection, testing, and certification requirements, and other procedural obstacles they create.

- (iii) Establish a competent national accreditation board which can accredit the testing and calibration laboratories for all the important standards and parameters.
- (iv) Formulate a national quality policy.
- (v) Create separate autonomous bodies for formulation of standards, implementation, monitoring, and conformity assessment.
- (vi) Undertake regulatory reforms to bridge gaps with the international and regional standards and to be able to adhere to international best practices.
- (vii) Harmonize standards at a regional level in the standards and regulations and other SPS measures and TBT that impede or delay trade.
- (viii) Enhance diplomacy regarding SPS measures and TBT.
- (ix) Formulate strategies and conduct periodic training for the development of human resources to address the implementation of SPS measures and/or TBT, as well as standardization problems created by an incompetent workforce and lack of experts.
- (x) Reduce the information gap to help exporters identify SASEC markets for their products and to ensure that they have necessary knowledge to fulfill SPS and TBT requirements.

Chapter 1

Introduction

1.1 Background and Context

The South Asia Subregional Economic Cooperation (SASEC) partnership brings together Bangladesh, Bhutan, India, Maldives, Nepal, and Sri Lanka to promote regional prosperity by, among other things, deepening regional integration, enhancing cross-border connectivity, and stimulating trade.¹ Despite commendable work by the SASEC program since its inception in 2001, intra-SASEC trade has not increased and diversified; rather, it has concentrated with India and stagnated at less than 1%, if India is excluded. The state of negligent trade with other SASEC countries except India begs the question as to why Nepal conducts most of its trade with other countries rather than with SASEC countries.

Many factors, including weak trade facilitation measures and burdensome transit procedures, contribute to this unfortunate scenario—and nontariff measures (NTMs) are one of the primary reasons. Studies and reports have pointed out that these NTMs are used as trade policies with protectionist intent.² For example, vegetable ghee is subject to a tariff rate quota and canalization when exporting to India; and exports of some agricultural products require an import permit in India.

A special set of NTMs—sanitary and phytosanitary (SPS) measures and technical barriers to trade (TBT)—present an interesting dilemma to exporters as well as policy makers: the same measures may be used to pursue both legitimate and protectionist goals, and the boundary between different motivations is very thin. The trade effects of such NTMs depend on the reasons behind the adoption and design. For example, if they are used to correct market failure such as information asymmetry, trade may be enhanced as consumer confidence in the product will increase demand for it. If the NTMs are employed with the intent to protect domestic producers, however, they are likely to reduce trade.³ Regardless,

¹ The SASEC program aims to promote regional prosperity, improve economic opportunities, and build a better quality of life for the people of the subregion. SASEC countries share a common vision of boosting intraregional trade and cooperation in South Asia, while also developing connectivity and trade with Southeast Asia through Myanmar, to the People's Republic of China (PRC), and the global market. See <https://www.sasec.asia/>. Myanmar joined SASEC in 2017 but is not a part of this diagnostic study.

² For example, Selim Raihan. 2016. *Enhanced Regional Economic Cooperation through Dealing with NTMs in the BBIN Sub-region in South Asia: A Political Economy Approach*. Dhaka; South Asian Association for Regional Cooperation. 2006. *Nepal Notification on NTMs/PTMs*. Kathmandu; and Floria A. Albuero. 2004. *Promoting Trade in SASEC: A Report on Non-tariff and Non-trade Barriers*. Manila.

³ Cristina Herghelegiu. 2018. The Political Economy of Non-Tariff Measures. *World Economy*. 41, pp. 262–68. Nottingham.

these measures have been found to be a major export impediment for least developed countries (LDCs)⁴—and Nepal is no exception.⁵

Although studies solely focused on the SPS and TBT constraints faced by Nepalese exporters are rare, some studies have pointed out how SPS measures and TBT have indeed been creating problems for Nepalese exporters. Raihan (2016), SAARC (2006), and Alburo (2004) offer instances where issues such as lack of recognition of test certificates and excessive testing requirements had created obstacles to trade. Similarly, Tika Bahadur Karki covers a wide array of topics related to SPS implementation in South Asian countries and discusses major SPS issues and constraints faced by South Asian Association for Regional Cooperation (SAARC) countries.⁶ Likewise, Kees van der Meer provides an in-depth analysis of SPS-related issues impeding Nepal's trade of agricultural and food products.⁷ ITC (2016a) also discusses some SPS, TBT, and procedural issues faced by exporters, particularly in tea, honey, ginger, cardamom, herbal and medicinal products, coffee, other food products, handmade paper and paper products, carpets, garments, leather products, and metal, wood, and other handicraft items. The Confederation of Nepalese Industries provides a similar analysis of SPS and TBT issues faced by exporters of lentils, tea, ginger, and medicinal and aromatic plants.⁸

As a member of the World Trade Organization (WTO), Nepal has obligations to abide by the WTO agreements related to SPS measures⁹ and TBT.¹⁰ This has led to some reforms in the form of amendments to legislations and introduction of new policies, as well as the establishment of national enquiry points for SPS measures and TBT.¹¹ The national enquiry points carry out the important functions of notifying and publishing various information regarding the existing and new SPS measures and TBT. However, Nepal still has a long way to go in achieving the capacity and resources to have the SPS measures and TBT align with international standards, and, most importantly, implement them in an efficient and expeditious manner. This lack of competence in effectively addressing the SPS measures and TBT has significant adverse effects on Nepal's export and trade—and consequently on its economic well-being.

⁴ The United Nations classification of least developed countries includes those with the lowest levels of socioeconomic development based on income, human resources, and economic vulnerability criterion. Currently there are 47 LDCs.

¹¹ The Department of Food Technology and Quality Control (DFTQC) under the Ministry of Agricultural Development acts as the SPS National Enquiry Point and the Nepal Bureau of Standards and Metrology (NBSM) under the Ministry of Industry acts as the TBT National Enquiry Point.

The analysis shows that there is a plethora of products that Nepal exports in significant volumes globally, but the level of exports in the SASEC region is insignificant or nonexistent. Many of these products are subject to SPS measures and TBT in other SASEC countries. If the trade has not occurred solely because of SPS measures and TBT, it poses an interesting question of how Nepal is able to meet the SPS and TBT standards in other countries, but not in SASEC countries. Is it because some of the SPS measures and TBT are in place in SASEC countries to protect domestic industries? Or is it because importing SASEC countries lack SPS and TBT infrastructure such as adequate laboratory testing facilities to efficiently carry out the conformity assessment procedures and hence increase the cost of SASEC trade? Or is it because SPS and TBT procedures at the SASEC borders are inefficient and hence delay the movement of goods, thereby increasing SASEC trade costs? Similarly, the other important questions would be: How big is the misalignment between Nepalese SPS and TBT regulations and the international standards? and How severe is the lack of SPS and TBT infrastructure in Nepal? These findings will provide us with much needed knowledge of the specific needs of Nepal in addressing SPS and TBT constraints.

1.2 Purpose and Scope of the Study

Against the backdrop of proliferation of the SPS measures and TBT, as well as their likely association with dismal intra-SASEC trade, the overarching purpose of this study is to complement the SASEC program's efforts to reduce and remove trade barriers, particularly SPS measures and TBT in the SASEC region.

The broad scope of the terms of reference for this national diagnostic study comprises the following:

1.2.1 Identifying Priority Products

- (i) Identifying the specific items with potential for exports from Nepal and subject to SPS measures and TBT of the importing SASEC countries.

1.2.2 Identifying Sanitary and Phytosanitary and Technical Barriers to Trade Constraints

Carrying out a national diagnostic audit, which includes

- (i) identifying current SPS and TBT infrastructure capacity constraints, and presenting prioritized recommendations for necessary future investments; and
- (ii) identifying priority national capacity-building activities in the areas of standards and regulations.

1.3 Methodology

The diagnostic study has two important aspects: (i) identifying priority products, and (ii) identifying critical SPS and TBT constraints. The methodology for identifying priority

products entails identifying products that Nepal exports in significant amounts to non-SASEC countries, but does not export at all or exports in negligible amounts to other SASEC countries, most likely because of the SPS measures and TBT these products face in other SASEC countries. Identifying critical SPS and TBT constraints is done through a gap analysis, which is also supplemented by a survey of exporters. Each step is discussed in detail.

1.3.1 Identifying Priority Products

The following methodology is used to identify 100 products that Nepal has high potential to export to other SASEC countries:

- (i) Trade data is examined for the years 2010–2014 (United Nations International Trade Statistics Database, or UN COMTRADE). Trade data for 2015 is purposely excluded as an economic blockade was imposed on Nepal at its Indian borders. To avoid the possibility that the economic environment at the time might have produced a misleading trade figure for the year, data analysis is limited up to 2014.
- (ii) To avoid outliers, products that have been exported only once within 2010–2014 are excluded.
- (iii) To ensure that Nepal's exports are not more expensive than imports from other nations, products are excluded where the average unit value of export of Nepal is higher than the average unit value of other SASEC countries. This ensures that Nepal's potential exports can compete with imports from other parts of the world.
- (iv) Products are excluded where Nepal's share in total imports of importing SASEC countries is more than 20%, assuming these products are traded significantly and the SPS and TBT issues are minimal.
- (v) Similarly, products for which the export value for each SASEC country constitutes a more than 20% share in total trade are excluded.
- (vi) Finally, only those products that are traded in significant amounts (e.g., \$100,000) are chosen to ensure the commercial viability of the exports. Products are not included where Nepal's global export is below the specified amount or where another SASEC country's global import is less than that specified amount. The specific amount will be different depending on which SASEC country is under investigation.

Based on secondary information, all SPS measures and TBT faced by the products obtained from steps (i) through (vi) in the SASEC country under investigation are compiled.

1.3.2 Identifying Critical Sanitary and Phytosanitary and Technical Barriers to Trade Constraints

The diagnostic study aims to identify the most critical SPS and TBT constraints that the potential products face. To this end, the diagnostic study includes the following two methods.

1.3.2.1 Gap Analysis

Based on a review of studies, field studies, and consultations with stakeholders, the gap analysis seeks to identify the major areas of nonalignment or conflict between national legislation, actual local practices, the SPS measures and TBT of SASEC countries, and international standards. The major steps in the gap analysis are the following:

- (i) Identifying Nepal's SPS measures and TBT—that is, identifying all the SPS measures and TBT that the potential priority exports of Nepal have to satisfy in Nepal before they are exported.
- (ii) Identifying Nepal's SPS and TBT agency—that is, the principal agency that overlooks the enforcement of SPS measures and TBT in Nepal.
- (iii) Identifying SPS measures and TBT of the importing SASEC country—that is, identifying all the SPS measures and TBT that the potential priority exports of Nepal have to satisfy in the importing SASEC country before these products are allowed entry into the market.
- (iv) Identifying the SASEC SPS and TBT agency—that is, the principal agency that overlooks the enforcement of SPS measures and TBT in the importing SASEC country.
- (v) Identifying the distance to international standards—that is, identifying whether the SPS measures and TBT of the importing SASEC country is based on international standards.
- (vi) Identifying procedural obstacles—that is, identifying the extent of SPS- and TBT-related procedural obstacles in both Nepal and the importing SASEC country.

Steps i-v will provide the level of misalignment of Nepal's SPS measures and TBT with those of other SASEC countries as well as with international standards. This finding can be crucial if SASEC countries are to harmonize their national standards or decide to adhere to international standards. Step vi will provide the obstacles posed by implementation of SPS measures and TBT. These findings will likewise be crucial if SASEC countries are to streamline procedural delays and impediments through capacity building and/or the use of a mutual recognition mechanism.

1.3.2.2 Survey of Exporters

The gap analysis was complemented by a survey of exporters to dig deeper into the impediments to trade resulting from SPS measures and TBT in SASEC countries. The survey exposed several important SPS and TBT issues, including (i) how Nepal is able to conform to SPS and TBT requirements of importers other than SASEC countries; (ii) the major problems associated with the compliance of SPS measures and TBT in SASEC countries; (iii) the extent of procedural hurdles caused by SPS and TBT conformity assessment in both Nepal and other SASEC countries; and (iv) actions required from the government's side to strengthen legal and institutional mechanisms to address SPS and TBT issues faced by identified priority products to other SASEC countries. Appendix 4 presents the major focus questions of the survey of exporters.

Following the introductory chapter, the diagnostic report is organized as follows: Chapter 2 discusses the pattern of Nepal’s import and export trade with other SASEC countries during 2014–2016. Chapter 3 identifies products which have the potential for export from Nepal to other SASEC countries, yet which may be subject to SPS and TBT requirements in the importing country. An overview of SPS measures and TBT in Nepal is laid out in Chapter 4, focusing on legal structures, institutional frameworks, and SPS- and TBT-related infrastructure. Chapter 5 identifies standards, regulations, and procedural obstacles in the SASEC countries that are impeding trade of Nepal’s identified potential export items. Based on the earlier discussions and findings, Chapter 6 provides prioritized recommendations for necessary future actions to mitigate SPS and TBT constraints, and Chapter 7 concludes the report.

Chapter 2

Pattern of Trade with Other SASEC Countries

2.1. Nepal–SASEC Trade Pattern

Although Nepal conducts an overwhelming amount of trade with India, the country's trade with other SASEC countries has been negligible over recent years and especially so in exports. Table 1 shows that although exports to SASEC countries comprise a significant portion of Nepal's global exports, the figures are unimpressive if we exclude India. Nepal saw its peak export to the SASEC region in 2008 (in absolute amount) because of record-high exports to India and Bangladesh. The exports to Bangladesh have declined significantly since then, from a peak of \$76.7 million in 2008 to merely \$12.9 million in 2016, which is mostly dominated by one product (lentils). In terms of exports to SASEC (and SASEC excluding India) as a share of Nepal's global exports, the highest figure was in 2010, because of strong exports to Bangladesh and Bhutan. Exports to Bhutan have declined steeply since 2010. Exports to Maldives and Sri Lanka are almost nonexistent and stagnant. Overall, exports to the world, India, and other SASEC countries have been declining after the record high on all fronts in 2008.

The import trade pattern is similar to that of exports. Although imports from SASEC form a significant share of Nepal's global imports, almost all of it is dominated by imports from India. Table 2 shows that Nepal's share of imports from SASEC, which is more than 60% since 2005, dwindles to an insignificant level at less than 1% if we exclude India. Imports from India are rising steeply, except for 2015 when they declined largely because of an informal economic blockade at the Indian border.¹² The sharp rise in imports from India contributes to an ever increasing and significant trade deficit in Nepal: this has been an issue of grave concern over the last few years. Imports from Bangladesh and Bhutan have also been posting a strong increase in recent times. However, imports from Sri Lanka have been more or less stagnant and imports from Maldives are almost nonexistent.

¹² The trade figures for 2015 should be treated as outliers for all the SASEC countries as well since most of Nepal's trade is executed through its Indian borders.

SASEC = South Asia Subregional Economic Cooperation.

Data source: Compilation from United Nations Conference on Trade and Development, Trade and Export Promotion Centre (for 2016), and author's computation.

Figure 1 illustrates Nepal’s trade with the SASEC region over the year, and clearly shows the conspicuously low level of trade with SASEC countries other than India.

2.2 Nepal’s Exports to SASEC Countries: Major Products and Composition

As discussed earlier, Nepal’s exports to SASEC countries are overwhelmingly dominated by exports to India and exports to the rest of the countries are noticeably low. Exports to all SASEC countries have either declined or are stagnant at a negligible level, as in the case of Maldives and more recently Sri Lanka. Figure 2 illustrates this scenario of Nepal’s exports to other SASEC countries during the period 2001–2016.

2.2.1 Nepal's Top Exports to SASEC Countries

Except for India, Nepal's exports to SASEC are concentrated around only a few products.¹³ Nepal's exports to Bangladesh are dominated by a single product; lentils (HS 071340)¹⁴ constitute a staggering 93.8% of the exports. Except for textile materials (HS 631010)—that is, twine, cordage, rope, or cables—the remaining eight top exports are agricultural and food products.

Liquid dielectric transformers (HS 850421) are Nepal's biggest export to Bhutan, comprising a significant 24.1% of the total. Furthermore, the top 10 exports to Bhutan constitute an overwhelming 93.6% of Nepal's export to Bhutan.

The largest shares of exports to India are of cardamoms (HS 090831), contributing 9.1%; woven fabric obtained from the strip (HS 540720), contributing 8.2%; and mixture of

¹³ Tables A.1.1–A.1.5 in the annex list details of Nepal's top exports to all the SASEC countries in 2016, including export values and shares.

¹⁴ HS (Harmonized System) is an internationally standardized product nomenclature system developed by the World Customs Organization (WCO) to achieve uniform classification of products for customs purposes. A standardized six-digit HS code (HS-6) is used internationally to describe the commodity that is shipped. The first two-digits (HS-2) represents a broad category that the product could be classified into, also known as the Chapter (for example, 07 represents the Chapter "Edible vegetables and certain roots and tubers") and the next two-digits (HS-4) represents the Heading, which are the groups within the Chapter (for example, the heading HS 0713 identifies the group "Dried leguminous vegetables, shelled, whether or not skinned or split"). The next two digits (HS-6) are used to identify specific products under the respective Chapter and Heading (for e.g. HS 071340 is used to identify lentils).

juices (HS 200990), contributing 7.5%. Although the top 10 exports to India constitute a significant 54.9% of its total export value to India, Nepal exports a significant and wide variety of products to India compared to other SASEC counterparts.

Only two products were exported to Maldives in 2016: twine, cordage, rope, or cables (HS 631010), comprising 82.8% of the export value; and cameras (HS 900651), comprising the remaining 17.2%. The total value of exports was \$813.

The export basket to Sri Lanka also comprised only four products: medicaments (HS 300440); carpets (HS 570110); twine, cordage, rope, or cables (HS 631010); and handbags (HS 42022).

2.2.2 Product Composition

Figure 3 displays different product categories’ contributions to Nepal’s exports to the world, India, and the other SASEC countries. Textiles and clothing comprise the highest share of Nepal’s exports, both to the world and to India. However, Nepal’s exports of clothing and textiles to other SASEC countries remain at an insignificant level. Similarly, agricultural products constitute the next biggest exports category to both the world and to India. Although the highest contributor to the exports to other SASEC countries, the export value remains insignificant. Prepared food, spirit, beverage, and tobacco is the next category of products that contribute to the exports to both the world and India. Once again, the export of this category of products to other SASEC countries is negligible. Base metals and related

articles; chemicals, plastics, and rubber-based products; and other manufactured products come next in the list of contributors to Nepal's export to the world and to India. Nepal's exports of machinery and transport equipment, and mineral products are negligible, which is understandable given the poor economic status and distance to technology frontiers.

In almost all product categories, India is an overwhelmingly dominant export destination. Although India receives a considerable share of Nepal's exports of textiles and clothing, significantly larger shares are exported to the rest of the world, mostly as a result of preferential treatment that Nepalese textiles and clothing receive in Europe and the United States. Although agricultural products constitute the biggest export basket to other SASEC countries, exports in all the product categories to other SASEC countries remain negligible.

2.3 Nepal's Important Trade Agreements with SASEC Partners

Nepal–India Trade Treaty: The Nepal–India Trade Treaty¹⁵ seeks the free and unhampered flow of goods through any measures, including technical cooperation, to promote, facilitate, expand, and diversify trade between Nepal and India (Ministry of Commerce and Industry 2009). It exempts customs duties and quantitative restrictions on the trade of primary products between Nepal and India. Under the treaty, Nepalese products enter Indian territory without being subject to basic customs duties and quantitative restrictions; Nepal provides full or partial exemption on customs duties and quantitative restrictions on imports from India. Furthermore, the trade agreement prohibits both member states to grant more preferable treatment to any other country with regard to customs duties and import regulations including quantitative restrictions. Acknowledging that the countries are in different phases of economic development, the agreement offers a few non-reciprocal trade preferences to Nepal, particularly the right to impose customs duties on imports of non-primary products to Nepal.

South Asian Free Trade Area: The Agreement on South Asian Free Trade Area (SAFTA)¹⁶ came into effect in 2006 and aspires to reduce customs duties of all traded goods to zero. It encompasses all SAARC members: Afghanistan, Bangladesh, Bhutan, India, Maldives, Nepal, Pakistan, and Sri Lanka. Consequently, it includes all the SASEC countries considered by this study.

Although tariffs on some commodities have been eliminated and tariffs on some others have been reduced, the SAFTA agreement is often criticized for its extensive sensitive list, which exempts a substantial number of commodities from tariff reductions. Furthermore, it has also been questioned for slow progress, lack of commitment to eliminate nontariff barriers, and an overall lack of strong political commitment among SAFTA members to achieve the goal of greater economic union.

¹⁵ Nepal–India Trade Treaty: <http://commerce.nic.in/trade/nepal.pdf>.

¹⁶ Agreement on South Asian Free Trade Area: <http://commerce.nic.in/trade/safta.pdf>.

Bay of Bengal Initiative for Multi-Sectoral Technical and Economic Cooperation:

Bringing together seven South Asian and Southeast Asian countries,¹⁷ the Bay of Bengal Initiative for Multi-Sectoral Technical and Economic Cooperation (BIMSTEC) seeks to facilitate technological and economic cooperation among the member states. It includes all the SASEC countries except for Maldives.

Currently, BIMSTEC has 14 priority sectors of cooperation: trade and investment, transport and communication, energy, tourism, technology, fisheries, agriculture, public health, poverty alleviation, counterterrorism and transnational crime, environment and natural disaster management, cultural cooperation, people-to-people contact, and climate change.¹⁸

The BIMSTEC Free Trade Framework Agreement has been ratified by all the member states, but the trade negotiation process has been lengthy and hence the BIMSTEC Free Trade Framework Agreement is yet to come into effect.

Initiative between Bangladesh, Bhutan, India, and Nepal: Besides the important agreements mentioned, a subregional framework between Bangladesh, Bhutan, India, and Nepal (BBIN) is working to promote cooperation on different topics.¹⁹ Although there is no exclusive trade agreement between the BBIN nations, enhancing transit and connectivity has been one of the major aspirations of BBIN initiative. To actualize the vision of enhancing regional connectivity for deeper economic cooperation, a BBIN Motor Vehicles Agreement (BBIN MVA) was signed in 2015.²⁰ The implementation of BBIN MVA, through enhancing connectivity and transit, could positively influence SASEC trade.

¹⁷ BIMSTEC currently comprises seven member states: Bangladesh, Bhutan, India, Nepal, and Sri Lanka from South Asia; and Myanmar and Thailand from Southeast Asia. See https://bimstec.org/?page_id=199.

¹⁸ See https://bimstec.org/?page_id=199.

¹⁹ Through Joint Working Group (JWS) sessions, BBIN group of nations have pursued sub-regional cooperation on issues such as Water Resources Management, Hydropower and on Connectivity and Transit. See, for example <https://mea.gov.in/press-releases.htm?dtl/26284/Third+Joint+Working+Group+JWG+Meetings+on+SubRegional+Cooperation+between+Bangladesh+Bhutan+India+and+Nepal+BBIN+January+1920+2016>.

²⁰ “Motor Vehicles Agreement for the Regulation of Passenger, Personal and Cargo Vehicular Traffic Between Bangladesh, Bhutan, India, and Nepal,” signed in 2015, was not ratified by the upper house in Bhutan. However, efforts are underway to operationalize the agreement among Bangladesh, Bhutan, and India.

Chapter 3

Identification of Products with Export Potential from Nepal to Other SASEC Countries

Using the procedures described in Section 1.3.1, this diagnostic study identifies around 100 products that Nepal exports at a significant level globally but inconspicuously or at a nonexistent level to one or more of the SASEC countries: this process is carried out for each SASEC country. Tables A2.1–A2.5 in Appendix 2 provide a list of potential export products for each country. The study also attempts to identify SPS measures and TBT associated with these products, although this is constrained by the lack of databases related to SPS measures and TBT. Tables A3.1–A3.4 in Appendix 3 provide details of SPS measures and TBT applicable to the identified potential products.

3.1 Potential Export Products from Nepal to Bangladesh

Figure 4 illustrates the chapter-wise categorization of the potential export products from Nepal to Bangladesh. The number of products in each HS chapter that attracts at least one SPS measure and/or TBT is also displayed.

The study identifies 129 potential export products using a threshold average annual global export value of \$100,000.²¹ Table A2.1 in Appendix 2 presents the list of these products. We were able to identify at least one SPS measure and/or TBT in Bangladesh for 35 commodities in the list of potential products for export to Bangladesh. The products that attract SPS measures and/or TBT predominantly include agricultural produce and food products, which comprise meat products, dairy products, other products of animal origin (bones and horn-cores), edible vegetables, spices, wheat flour, animal or vegetable fats and oils, preparations of cereals, preparations of vegetables and fruits (tomato juice, fruit juice, etc.), residues and waste from the food industries, and miscellaneous edible preparations. The other products include organic chemicals, soaps, insecticides, paper products, made-up textile articles, glassware, iron and steel products, and electrical machinery and equipment. Table A3.1 in Appendix 3 provides details of SPS measures and TBT associated with potential exports to Bangladesh.

²¹ Other conditions apply as well, which are discussed in the methodology in section 1.3.

Figure 4: Chapter-wise Potential Export Products to Bangladesh and Incidence of Sanitary and Phytosanitary Measures and Technical Barriers to Trade

HS = harmonized system, SPS = sanitary and phytosanitary, TBT = technical barrier to trade.

Source: Author's compilations from Appendixes 2 and 3 created from various sources.

3.2 Potential Export Products from Nepal to Bhutan

Figure 5 illustrates the chapter-wise categorization of the potential export products from Nepal to Bhutan. The number of products in each HS chapter that are associated with at least one SPS measure and/or TBT is also displayed.

The study identifies 98 potential export products using a threshold average annual global export value of \$20,000. Table A2.2 in Appendix 2 presents the list of these products.

At least one SPS measure and/or TBT is identified in Bhutan for 32 commodities in the list of identified potential products for export to Bhutan. The commodities that are associated with SPS measures and/or TBT in Bhutan largely include agricultural products and articles of plastic. A few pharmaceutical products are also included in the list. Table A3.2 in Appendix 3 provides details of SPS measures and TBT associated with potential exports to Bhutan.

3.3 Potential Export Products from Nepal to India

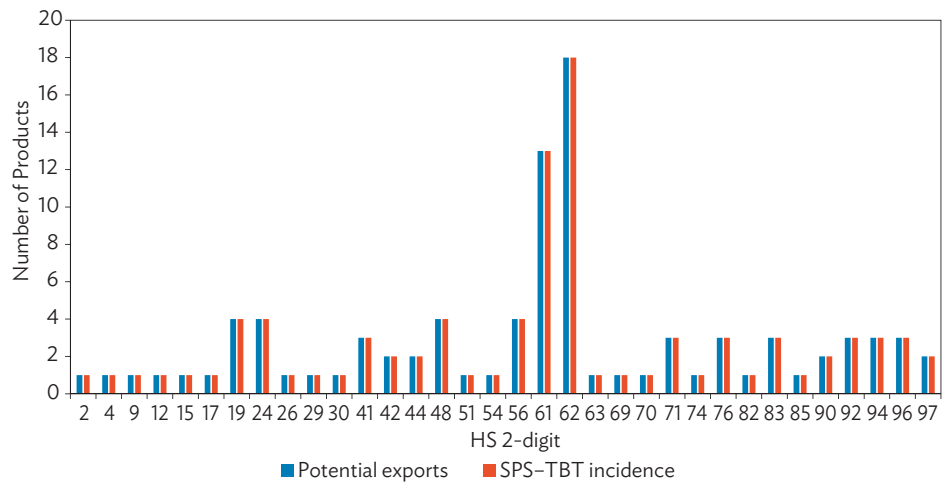

Figure 6 illustrates the chapter-wise categorization of the potential export products from Nepal to India. The number of products in each HS chapter that are associated with at least one SPS measure and/or TBT is also exhibited.

Figure 5: Chapter-wise Potential Export Products to Bhutan and Incidence of Sanitary and Phytosanitary Measures and Technical Barriers to Trade

HS = harmonized system, SPS = sanitary and phytosanitary, TBT = technical barrier to trade.
 Source: Author's compilations from Appendixes 2 and 3 created from various sources.

Figure 6: Chapter-wise Potential Export Products to India and Incidence of Sanitary and Phytosanitary Measures and Technical Barriers to Trade

HS = harmonized system, SPS = sanitary and phytosanitary, TBT = technical barrier to trade.
 Source: Author's compilations from Appendixes 2 and 3 created from various sources.

The study identifies 93 potential export products using a threshold average annual global export value of \$50,000. Table A2.3 in Appendix 2 presents the list of these products. At least one SPS measure and/or TBT in India is identified for all the 93 commodities in the list of identified potential products for export to India. The majority of products in the list include textile and clothing products. The list is also composed of substantial amounts of agricultural and food products, which include meat, cheese, coffee husks and skins, seeds, animal or vegetable fats and oils, sugar confectionery, sweet biscuits, tobacco and tobacco products, and prepared food products. The other products include pharmaceutical products, chemical products, plastic products, raw hides and skins, leather articles, paper products, ceramics, glassware, jewelry, iron and steel products, aluminum products, machinery and equipment, and miscellaneous manufactured articles. Table A3.3 in Appendix 3 provides details of SPS measures and TBT associated with potential exports to India.

3.4 Potential Export Products from Nepal to Maldives

Figure 7 illustrates the chapter-wise categorization of the potential export products from Nepal to Maldives. The study identifies 108 potential export products using a threshold average annual global export value of \$75,000. Table A2.4 in Appendix 2 presents the list of these products.

Figure 7: Chapter-wise Potential Export Products to Maldives

HS = harmonized system.

Source: Author's compilations from Annex A.2 for which data were drawn from the United Nations Commodity Trade Statistics Database (UN Comtrade).

It is not possible to identify the products in the list that are subject to at least one SPS measure and/or TBT in Maldives due to the lack of studies on SPS measures and TBT in Maldives, as well as unavailability of their legislation and other regulatory documents in English.

3.5 Potential Export Products from Nepal to Sri Lanka

Figure 8 illustrates the chapter-wise categorization of the potential export products from Nepal to Sri Lanka. The number of products in each HS chapter that are associated with at least one SPS measure and/or TBT is also displayed.

The study identifies 101 potential export products using a threshold average annual global export value of \$150,000. Table A2.5 in Appendix 2 presents the list of these products.

At least one SPS measure and/or TBT in Sri Lanka is identified for 37 commodities in the list of identified potential products for export to Sri Lanka. The list comprises several agricultural products, which include meat, live plants, nuts, tea, spices, plants and parts of plant including seeds and fruit, fixed vegetable fats and oils, sweet biscuits, fruit juices, nonalcoholic beverages, residues and waste from the food industries and animal fodder, and miscellaneous edible preparations. The rest of the list comprises natural sand, organic

chemicals (vitamins), pharmaceutical products, coloring matters, cosmetics and perfumery, articles of plastic, paper products, carpets and other textile floor coverings, articles of aluminum, machinery and equipment, wooden furniture, and mattresses. Table A3.4 in Appendix 3 provides details of SPS measures and TBT associated with potential exports to Sri Lanka.

Chapter 4

Overview of Sanitary and Phytosanitary Measures and Technical Barriers to Trade in Nepal

4.1 The Sanitary and Phytosanitary Scenario

4.1.1 The Legal Structure

Attempts to regulate the quality of food and protect consumers from adulterated, contaminated, and substandard food began in Nepal in 1967 with the adoption of the Food Act. The need for a broad SPS mechanism became more urgent after the proliferation of international trade through increased trade liberalization in the 1990s and more pronounced after Nepal's accession to the World Trade Organization (WTO) in 2003. Furthermore, accession to the WTO also obliged Nepal to update legislations that could address broad SPS concerns and develop SPS measures that adhere to international standards. As a result, some legislations were amended and some laws were introduced to reduce or remove the gaps with international standards. Currently, the following laws form the basis for SPS measures in Nepal:

- **Food Act, 1967 (2023) and Food Rules, 1970 (2027)** to protect human life or health from foodborne risks arising from additives, contaminants, toxins, or disease-causing organisms in foods and beverages.
- **Animal Health and Livestock Service Act, 1999 (2055) and Animal Health and Livestock Service Rules, 2000 (2056)** to protect animal life or health from diseases carried by animals and human life or health from risks arising from food products derived from animals.
- **Animal Slaughterhouse and Meat Inspection Act, 1999 (2055) and Slaughterhouse and Meat Inspection Rules, 2001 (2057)** to protect human life or health from foodborne risks arising from contaminated meat and meat products.
- **Feed Act, 1976 (2033) and Feed Regulation, 1984 (2041)** to protect animal life or health from foodborne risks arising from additives, contaminants, toxins, or disease-causing organisms in feedstuffs.
- **Plant Protection Act, 2007 (2064) and Plant Protection Rules, 2010 (2066)** to protect plant life or health from the entry, establishment, or spread of pests.
- **Seeds Act, 1988 (2045) and Seeds Regulations, 1997 (2054)** to protect plant life and health and promote biosafety by ensuring the availability of quality seeds.
- **Pesticides Act, 1991 (2048) and Pesticides Rules, 1994 (2050)** to protect human life or health and plant life or health by regulating the use of pesticides.

Besides these binding legislations, the **National Agriculture Policy, 2004** and the **Agriculture Development Strategy (ADS), 2014** also commit to mitigating various SPS constraints.

Figure 9 lists the legislations overseeing the three pillars of the WTO SPS Agreement: human life or health, animal life or health, and plant life or health.²²

4.1.2 The Institutional Framework

The Ministry of Agricultural Development is the key government institution that oversees the enforcement of SPS measures through different departments. Additionally, the Ministry of Livestock Development administers SPS measures related to the protection of animal health and life as well as human health and life associated with animal and animal products. The following are the core government bodies of SPS enforcement in Nepal:

4.1.2.1 Department of Food Technology and Quality Control

The Department of Food Technology and Quality Control (DFTQC) under the Ministry of Agricultural Development is the apex body for food safety and quality control. It is

²² Appendix A.1 of The WTO Agreement on the Application of Sanitary and Phytosanitary Measures (SPS Agreement) defines an SPS measure as any measure applied: to protect animal or plant life or health from risks arising from the entry, establishment or spread of pests, diseases, disease-carrying organisms or disease-causing organisms; to protect human or animal life or health from risks arising from additives, contaminants, toxins or disease-causing organisms in foods, beverages or feedstuffs; to protect human life or health from risks arising from disease carried by animals, plants or products thereof, or from the entry, establishment or spread of pests; to prevent or limit other damage from the entry, establishment or spread of pests. See https://www.wto.org/english/tratop_e/sps_e/spsagr_e.htm.

responsible for ensuring that food available to Nepalese consumers is safe and nutritious. It is the designated government body for implementing the food and feed acts and regulations in the country. The major activities and responsibilities undertaken by the DFTQC (2016) are food and feed inspection, food industry licensing, development of new food standards, consumer awareness campaigns, and export and import certification. It also acts as the SPS National Enquiry Point and Codex Alimentarius contact point, and is thus responsible for coordinating with the SPS-related national and international agencies as well as providing information related to SPS measures upon inquiry.

4.1.2.2 Plant Protection Directorate

The Plant Protection Directorate under the Ministry of Agricultural Development is responsible for the formulation and implementation of plant protection policies. It also serves as the official contact point for the International Plant Protection Convention and the Asia and Pacific Plant Protection Commission and as the focal point for the National Plant Protection Organization. Its major activities are ensuring plant health through inspection, testing, and certification of plant and plant products as well as through operating plant quarantine check posts under the National Plant Quarantine Program. It is also responsible for control of pesticides.

4.1.2.3 Seed Quality Control Centre

The Seed Quality Control Centre under the Ministry of Agricultural Development is responsible for ensuring that seeds available in the market are of superior quality and hence plays a major role in protecting plant life and health as well as in promoting biosafety. It is the sole government body responsible for enforcing the Seeds Act, 1988 and the Seeds Regulation, 1997. Its major activities related to SPS measures are developing and revising the seed standards, as well as preparing seed testing guidelines, monitoring and inspection of seed laboratories, issuing seed certification and monitoring of certification works, and registration of imported and exported seeds.

4.1.2.4 Department of Livestock Services

The Department of Livestock Services under the Ministry of Livestock Development is the apex body for protecting animal life or health through prevention and control of diseases. It also serves as the department for protection of human life or health from risks arising from food products of animal origin. Enforcement of the Animal Health and Livestock Service Act and Rules as well as the Animal Slaughterhouse and Meat Inspection Act fall under its jurisdiction. Its major activities are conducting inspection, testing, and certification of animal and animal products, as well as ensuring animal health through operating the animal quarantine check posts.

4.1.3 Gap Analysis

Nepal has been undergoing major legislative reforms through introduction of new legislations as well as through amendments of existing legislations to meet international standards as well as its obligations under the WTO. The majority of the regulations that

are formulated or revised adhere to the standards and guidelines presented by Codex Alimentarius (for food standards), World Organisation for Animal Health (OIE), and the International Plant Protection Convention, and are therefore aligned with the generally accepted international standards. However, some legislative work still needs to be done to expand the scope of its regulatory mechanism to include all current SPS-related international standards and guidelines to ensure product compliance and seamless export from Nepal. Important gaps that Nepal should address to ensure that SPS requirements are listed below.

4.1.3.1 Gaps in Standards

Food standards developed by the DFTQC are reported to adhere to Codex Alimentarius standards and are considered on par with the generally accepted international standards. However, a closer investigation reveals that some chemicals and other contaminants considered dangerous are not included in the Nepalese Food Standards. Some of them are as follows:

- (i) 3-MCPD in hydrolyzed vegetable protein and soy sauce (maximum levels are set by the European Union [EU] and other countries);²³
- (ii) dioxins and dioxin-like polychlorinated biphenyls (PCBs) in meat, fish, milk, eggs, oils, and fats (maximum levels are set by the EU and other countries);
- (iii) polycyclic aromatic hydrocarbons (PAHs) in oils and fats, smoked meats, smoked fish, and fish, among others (maximum levels are set by the EU and other countries);
- (iv) melamine levels (maximum levels set by the EU as well as the Codex guidelines);²⁴
- (v) erucic acid (maximum levels set by the EU); and
- (vi) nitrates in lettuce, spinach, and baby foods (maximum levels set by the EU).

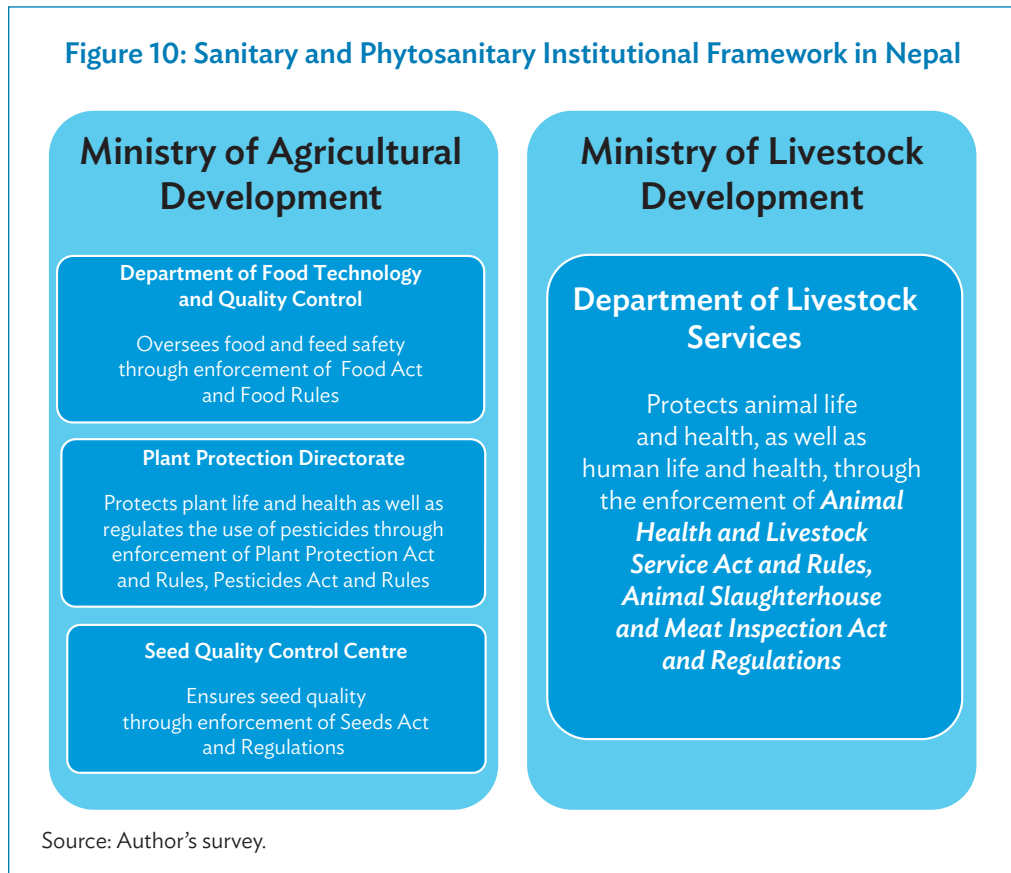

Alongside these contaminants, a common international standard in food relates to the maximum levels of radioactive contamination of food products. However, Nepal has not restricted the levels of radioactive substances in food products. The absence of maximum levels of permitted radioactive materials in Nepalese food standards increases the risk of importing hazardous foodstuffs.

A more detailed analysis of such contaminants is likely to expose gaps in other parameters crucial to maintain as well as conform to food safety. Thus, the standard-setting body (DFTQC) should update and incorporate all the necessary parameters in its standards.

²³ More information on these contaminants and maximum levels set by the European Union can be found at <http://trade.ec.europa.eu/tradehelp/>.

²⁴ The DFTQC is currently preparing new regulations related to melamine testing.

Figure 10: Sanitary and Phytosanitary Institutional Framework in Nepal

4.1.3.2 Deviation from International Practice

Comparing Nepal's SPS-related standards with current international norms divulges some clear gaps. The major gaps that should be addressed on a priority basis include:

- (i) **Traceability:** When it comes to food products, farm-to-fork traceability is increasingly a major requirement, necessitating the ability to track-and-trace food, feed, and any other substances that will be used in the food, through all stages: production, storage, processing, and distribution. Food traceability contributes to food safety by allowing withdrawals of nonconforming batches and product recalls; by providing accurate information to consumers, thereby guaranteeing product authenticity; and by improving overall product quality and processes through identification of sources of noncompliance (Ene 2013). However, Nepal does not have a regulatory framework to ensure that food and feed business operators meet the traceability requirements, which poses a significant roadblock for Nepalese agrifood business operators.
- (ii) **Hazard Analysis and Critical Control Points:** Commonly used to ensure food safety, the Hazard Analysis and Critical Control Points (HACCP) process lays out a set of principles to ensure that potential hazards at each critical control point are monitored and hence prevented, eliminated, or reduced. This kind of

hazard control is already mandatory in many countries and will remain binding in many other countries as living standards continue to rise. However, Nepal has yet to adopt HACCP as a mandatory requirement for food producers. The inability to conduct quality control at each stage of the food chain can pose significant constraints for Nepalese exporters to meet the rigorous quality requirements for international markets.

- (iii) **Food contact materials:** Besides the food product itself, food safety requires that the food products are not contaminated, altered, or deteriorated through contact with other materials (e.g., packaging materials, transportation containers, machineries, kitchenware). Thus, many countries have regulations in place to specify the list of authorized food contact materials as well as guidelines for their use. However, SPS-related legislations in Nepal are largely inadequate to encompass the food contact materials.
- (iv) **Labelling requirements:** Labelling requirements practiced in Nepal do not reflect current international norms and do not meet Codex Alimentarius standards in many instances. Under current labelling requirements, consumers are likely to be prevented from making an informed choice about the product through lack of accurate information. The following instances demonstrate substandard labelling requirements in Nepal:
 - (a) Declaring foods and ingredients known to cause severe allergic reactions, intolerances, and hypersensitivity is mandatory under Codex guidelines and many other international laws. For example, the EU requires labelling in cases where the food contains the following ingredients: cereals containing gluten, crustaceans, eggs, fish, peanuts, soybeans, milk, nuts, celery, mustard, sesame, sulfur dioxide or sulfites, lupin, and molluscs.²⁵ This requirement is not covered by the Nepalese Food Act and Rules.
 - (b) Nutrition declaration in the form of energy value, fat content, saturated fat content, carbohydrate content, sugar content, salt content, and protein content is rapidly becoming the international norm. The EU has made such nutrition declaration mandatory since 13 December 2016, yet Nepal's current labelling regulations do not make mandate it.
 - (c) The Food Act and Rules specify labelling requirements for coloring agents and preservatives yet do not cover other food additives such as emulsifiers, antioxidants, glazing agents, thickeners, etc.
 - (d) Storage instructions and instructions for use are not covered under Nepalese labelling requirements.
 - (e) Nepalese food legislations do not mandate labelling requirements for food that has been irradiated or food that contains irradiated ingredients, which is contrary to international practice.
 - (f) Labelling is required for foods consisting of or containing genetically modified organisms and novel foods: again, this is not specified by Nepalese food regulations.

²⁵ See <http://allergytraining.food.gov.uk/english/food-allergy-facts.aspx> for more information on the issue of labelling allergens.

Genetically modified organisms: The SPS-related regulatory framework in Nepal does not cover genetically modified organisms (GMOs).²⁶ Many importing countries, most notably the EU, as well as India and Sri Lanka amongst SASEC countries, require that food and food products consisting of or containing genetically modified parts and ingredients be labelled as such. Alongside the labelling requirement, food products consisting of or containing GMOs can be imported only after exporters fulfill special authorization requirements.

The gaps in standards and the inability to incorporate the international best practices discussed above lead to deficiencies in the SPS requirements for almost all food products.

4.1.3.3 Institutional Gaps

As noted above, one major regulatory gap is the lack of a legislative framework to ensure that HACCP requirements are met and quality is maintained at each point in the food value chain, be it production, harvesting, storage, or distribution. HACCP is already a mandatory requirement in many developed countries, and rising incomes and quality of life in other countries will likely imminently make HACCP a requirement for a large group of countries. Hence, to ensure that Nepal is able to continue exporting the food products that it currently exports, as well as to ensure that the agricultural products identified in this diagnostic study can be smoothly exported, HACCP should be implemented through legislative provisions, increased awareness among farmers, and an increased institutional capacity to ensure that HACCP requirements are met. Meer (2015) also criticizes Nepal's regulatory framework for focusing more on food quality than food safety and proposes a risk-based preventive approach.

The Food Act is mostly concerned with the final product and does not have the regulatory power over other stages of food production—leaving a huge gap in food safety. This points to an urgent need for comprehensive SPS legislation that addresses the issues of food safety at each stage.²⁷

Another issue with the current legislative framework is that the Food Act is more concerned with the production, sale, and distribution of food only within Nepalese territory and has not expanded its many regulations to food and food products that are exported or imported. Although the DFTQC has been constantly updating and revising its food standards to make them compatible with Codex Alimentarius, there are no inspection, testing, and certification requirements for exports and imports under the current Food Act. Similarly, registration requirements only apply to domestic producers, sellers, and distributors, as it is not specified that they apply to exporters and importers as well. Such lapses could potentially increase the risk of exporting and/or importing adulterated, contaminated, and substandard food products.

The lack of institutional capacity to conduct pest risk analysis has also been a major SPS constraint for Nepal's exports of agricultural and food products. Meer (2015) highlights the insufficient capacity in plant pest surveillance and diagnostics as a major SPS-related issue.

²⁶ It was pointed out during the National Validation Meeting that the DFTQC is currently working to address the issue.

²⁷ A new Food Act has been drafted and is awaiting approval from Parliament. It will hopefully address all these concerns.

Box 1: Current Initiatives at the Department of Food Technology and Quality Control Relevant for Mitigating Sanitary and Phytosanitary Constraints

- In response to criticism for focusing more on food quality than food safety, the Department of Food Technology and Quality Control (DFTQC) has turned attention to some areas of food safety as well. Microbiological tests are currently being designed and are expected to be implemented soon. Similarly, standards related to chemical and pesticide contaminants are in the process of being upgraded, and tests for chemical and pesticide contaminants are also being carried out.
- The DFTQC is in the process of developing guidelines on fit-for-human-consumption standards.
- The DFTQC is coming out with new regulations related to melamine requirements and testing.
- The DFTQC is also looking at incorporating the standards related to Good Manufacturing Practice and Hazard Analysis Critical Control Point processes for several products with assistance from the European Union.
- The DFTQC is currently preparing guidelines to deal with the issues of novel food: Aaharpurak Khadya Padhartha Sambandhi Nirdeshika.
- The DFTQC is planning to establish a national reference laboratory similar to that of the Agriculture Development Strategy. Furthermore, under the federal structure, the DFTQC is planning to upgrade regional laboratories into specialized laboratories to accommodate the need of the region better.
- The DFTQC is also working closely with the National Accreditation Board for Testing and Calibration Laboratories to increase its accreditation parameters.

Source: SASEC SPS and TBT Diagnostic Study for Nepal: National Validation Meeting, 31 October 2017, Kathmandu, Nepal.

The inability to conduct pest risk analysis—and hence the lack of data on pest incidence—was also cited as a critical constraint during the survey of exporters carried out for this diagnostic study.²⁸

Another major institutional gap is the inability of concerned food safety bodies to raise awareness and capacity at the grassroots level. This is of grave importance given that the food value chain is not well integrated in Nepal. Many problems in food safety arise from the lack of awareness or competency in the initial nodes of the food chain. For example, several cases of adulterated milk occur because the producer supplying the milk to the collection center is oblivious to the fundamental aspects of milk safety (as pointed out in the survey carried out for this diagnostic study) or lacks the awareness, competency and willingness to adhere to all the specified safety measures.²⁹ These risks are exacerbated by the fact that collection centres lack awareness and competency to prevent contamination.³⁰

²⁸ The list of firms and commodity associations surveyed for this diagnostic study could be found in Appendix 5.

²⁹ Details available at <https://thehimalayantimes.com/opinion/food-safety-challenges-dairy-industry/>.

³⁰ Details available at <http://kathmandupost.ekantipur.com/printedition/news/2016-11-04/collection-centres-blamed-for-contamination-in-milk.html>.

Lastly, a lack of human resources with competent skills to implement SPS measures also poses barriers to trade. Mostly because of complex government procedures preventing the hiring of employees at will and the constant transfer of government employees to other departments, there is a dearth of competent food inspectors, risk analysis-related personnel, quality control officers, animal quarantine officers, veterinary officers, plant protection officers, plant quarantine officers, and laboratory technicians. During consultations for this study, it was noted that the DFTQC has not seen a noteworthy increase in the number of employees since its inception, which has been a major cause of delay in conformity assessment procedures and other inadequate implementation of SPS measures. This problem of insufficient numbers and constant transfer of staff also persists in other SPS agencies such as the National Plant Quarantine and Animal Quarantine Organization.

Although serious issues persist, the DFTQC has been undertaking several initiatives to deal with the most urgent SPS constraints: Box 1 presents some key ongoing activities at the DFTQC, which could address some of the SPS issues mentioned here.³¹ However, these actions should be expedited for timely mitigation of SPS impediments.

4.1.3.4 Infrastructure Gaps

Major SPS-related testing services are provided by the DFTQC through its Central Food Laboratory, five regional food laboratories, and four food quarantine laboratories. However, only the Central Food Laboratory in Kathmandu provides sophisticated and accredited testing, whereas the regional food laboratories and quarantine food laboratories provide only the basic nonaccredited testing services. The government laboratories at the Nepal Bureau of Standards and Metrology (NBSM) and the Central Seed Testing Laboratory of the Seed Quality Control Centre, as well as a private institute (Zest Laboratories (P) Ltd), also provide some SPS-related accredited testing facilities. However, testing facilities for many essential parameters such as pesticide residues, as well as microbiological and chemical tests for a vast majority of products, are still not accredited.

ITC points out that the testing laboratories and certification bodies within Nepal are very limited and have a long way to go to develop capacity to be accredited for a wide range of products and management system certificates.³² The survey of exporters carried out for this study pointed out that this significant dearth of accredited testing facilities is a major constraint. Since only limited products and parameters are covered by the existing SPS infrastructure in Nepal, exporters must get procure the majority of testing procedures in accredited laboratories abroad, substantially raising the associated financial and time costs. In some cases (e.g., herbal products), exporters trade only to those importers who handle the testing requirements on their own resources.

Table 3 displays testing facilities in Nepal that are accredited, and Table 4 lists testing services that are not accredited.

³¹ Most of these initiatives were pointed out by the concerned authority at the DFTQC during the National Validation Meeting, 2017.

³² ITC. 2016. *Managing Quality in Nepal: A Directory of Services for SMEs*. Geneva.

Table 3: Accredited Sanitary and Phytosanitary Testing Facilities Provided by Public and Private Laboratories in Nepal

Laboratory	Group of Products, Materials, or Items Tested	Specific Tests or Types of Tests Performed	Accreditation
Nepal Bureau of Standards and Metrology (NBSM)	Water (mineral water, bottle packed processed drinking water, natural spring water, tap water, groundwater)	pH, total dissolved solids, chloride, total hardness, iron, manganese, cadmium, chromium, nickel, copper, zinc, lead	National Accreditation Board for Testing and Calibration Laboratories (NABL) accredited according to ISO/IEC 17025-2005 requirements
	Instant noodles	Moisture, total ash, acid insoluble ash, gruel content, total protein, acid value of extracted fat, peroxide value of extracted fat, acid value of pocket oil, peroxide value of pocket oil	
	Refined vegetable oil-mustard oil, soya oil, sunflower oil, and palmoline oil	Moisture content, free fatty acid, saponification value, iodine value, refractive index reading at 40°C and specific gravity at 40°C, peroxide value	
	Refined vegetable fat	Moisture content, free fatty acid, peroxide value, melting range, Butyro-Refractometer reading at 60°C	
	Wheat flour and maida	Moisture (%), total ash (%), acid insoluble ash (%), gluten (%), crude fiber (%), alcoholic acidity (%), granularity	
	Biscuits and cookies	Gross weight, net weight, moisture (%), total ash (%), acid insoluble ash (%), free fatty acid (%), protein content (%), fat content (%), crude fiber (%), carbohydrate (%), energy value, iron	
	Beer	Ethyl alcohol content, pH, carbon dioxide, lead, copper, iron	
Department of Food Technology and Quality Control	Edible oils and fats	Free fatty acid, refractive index, acid value, peroxide value	NABL accredited according to ISO/IEC 17025-2005 requirements
	Processed fruits and vegetables (juices, ketchup, pickle, jam)	Soluble solid content, acidity, total bacterial count, yeast and mold count, coliform count	
	Herbs, spices, and condiments (ginger, cardamom, turmeric)	Volatile oils	
	Tea and coffee	Total ash, water extract	
	Cereal and cereal products (instant noodles, biscuits, snacks)	Moisture, protein; total bacterial count, yeast and mold count, coliform count	
	Bakery and confectionery	Total bacterial count, yeast and mold count, coliform count	

continued on next page

Table 3 continued

Laboratory	Group of Products, Materials, or Items Tested	Specific Tests or Types of Tests Performed	Accreditation
	Honey	Moisture, acidity as formic acid	
	Raw and pasteurized milk	Fat content	
	Milk and dairy products	Total bacterial count, yeast and mold count, and coliform count for skimmed and whole milk powder, and condensed milk; moisture, protein, ash content, fat, and milk fat for processed milk, skimmed and whole milk powder, infant foods, and condensed milk	
	Processed drinking water	Potential hydrogen, hardness, alkalinity, chloride content, metal by atomic absorption spectroscopy, calcium, copper, iron, manganese, zinc, total bacterial count, yeast and mold count, coliform count, <i>Escherichia coli</i>	
Central Seed Testing Laboratory of Seed Quality Control Centre	Seed materials	Sampling, purity, and other seed determinations; germination, moisture content, weight determination	International Seed Testing Association, as per its constitution
Zest Laboratories (P) Ltd.	Green tea, tea, flour, edible oil, edible ghee, honey, salt, sugar	Moisture content, peroxide value, alkalinity of soluble ash, water soluble ash, water extract, acidity as formic acid, total ash, moisture content, acid value	NABL accredited according to ISO/IEC 17025-2005
	Drinking water	Iron, ammonia, chloride, potential hydrogen, zinc, lead, arsenic, cadmium, manganese, total dissolve solids, conductivity, total hardness, calcium, microbial contamination	

IEC = International Electrotechnical Commission, ISO = International Organization for Standardization.

Source: ITC (2016b) and recent updates from the Department of Food Technology and Quality Control and NBSM records.

Besides the laboratories already mentioned, a few private laboratories (Water Engineering and Training Center, Nepal Environmental Scientific Services Pvt. Ltd., CEMAT Water Lab Pvt. Ltd., Astha Lab Pvt. Ltd., Seam-N-Lab [Nepal Batabaraniya Sewa Kendra], and Zest Laboratory Pvt. Ltd.) and a nongovernment organization (Environment and Public Health Organization) are also providing SPS-related testing facilities with limited scope for certain products. However, they are not internationally accredited.³³

Even though some of the testing facilities provided by the NBSM and DFTQC are internationally accredited, the lack of accredited testing facilities in other essential parameters (Table 9) leaves exporters unable to certify that the food product is wholesome. This situation compels exporters to use foreign laboratories or the National

³³ Table 13 provides details of testing facilities provided by these laboratories.

Table 4: Nonaccredited Sanitary and Phytosanitary Testing Facilities Provided by Government Laboratories in Nepal

Laboratory	Product/Material/Scope of Test
Nepal Bureau of Standards and Metrology	Microbiological laboratory
Department of Food Technology and Quality Control	Microbiological laboratory (except for the current accredited scopes mentioned in Table 3) Food and feed laboratory (except for the current accredited scopes mentioned in Table 3) Instrumental laboratory Food contaminants/additives laboratories Reference laboratory Research and development laboratory Five regional food laboratories Four food quarantine laboratories in four places
Regional laboratories of the Department of Agriculture	Soil, seed, fertilizers, pesticides
Laboratories of the Nepal Agricultural Research Council	Soil, seed, pesticide, fertilizers, food, and plant quarantine-related tests
Central and regional veterinary laboratories of the Directorate of Animal health	Veterinary drugs and/or residues, animal quarantine-related tests, avian influenza type A antibody detection, brucellosis and salmonella investigations
Department of Plant Resources	Non-timber forest products: phytochemical screenings, pharmacological tests, extractive values, toxicity tests, essential oils, etc.

Source: ITC (2016b).

Accreditation Board for Testing and Calibration Laboratories (NABL) in Kolkata, again causing significant delay and/or costs. Most urgent are the microbiological laboratories, and food contaminants and additives laboratories testing provided by these bodies are required for virtually all agricultural and food products.

Exporters are forced to resort to other ways of fulfilling SPS requirements because of the delays in testing processes and issuance of certification by the DFTQC, and, in many cases, the lack of information among the exporters that testing facilities are available in the DFTQC.

Some internationally accredited testing services offered by the DFTQC are only available at the laboratory located at their headquarters in Kathmandu. As a result, more geographically remote manufacturers and exporters incur bigger financial and time costs to have their products tested due to the lack of accredited testing services in regional food and food quarantine laboratories.

4.1.3.5 Procedural Obstacles

Commonly reported SPS-related procedural obstacles noted in background literature, news reports, and the exporters' survey conducted for this study include the following:

- (i) Procedures, regulations, and requirements are applied inconsistently at customs potentially because of a lack of capacity and knowledge on procedures by customs officials or due to informal payment seeking.
- (ii) Excessive documentation requirements cause significant loss of time and cost. In many cases, the requested documentation is not a legal requirement but rather a strategy to receive informal payments.
- (iii) Substantial delays in obtaining authorization and/or approval.
- (iv) A lack of coordination and cooperation among various government bodies lead to the need to obtain approval from several entities. Lack of coordination among quarantine posts and customs check points was also cited as a problem during exporter survey consultations. For example, quarantine inspections are required only if directed by the customs: however, customs occasionally fails to coordinate properly with quarantine check posts and as a result products enter the market without undergoing the necessary quarantine checks.
- (v) Procedures are outdated (e.g., lack of automation).
- (vi) Requests for informal payment to customs and quarantine officers are reported as commonplace by the exporters surveyed for this study.

The diagnostic study reveals substantial SPS implementation gaps directly and indirectly affecting Nepalese exports, with the major SPS-related challenges confronting Nepal succinctly summed up as follows: inadequate infrastructure and human resources; weak coordination and cooperation among different institutions; inadequate capacity of laboratory in terms of equipment, methods, accreditation; separate regulation at different stages of the food chain; inadequate capacity related to export and import certification; inadequate human resources capacity to carry out risk analysis and HACCP-based industry inspection; weak infrastructure for conformity assessment; non-recognition of certification and testing; and high cost of conformity assessment.³⁴

Alongside the regulatory inadequacies that exist in the legislative framework, there are also other issues associated with the enforcement of SPS measures that are relatively challenging to address. While the regulatory gaps may be addressed in the shorter term with the introduction of new and revised legislations, significant amounts of time and investment will be needed to resolve infrastructure, procedural, and human capital gaps.

4.2 The Technical Barriers to Trade Scenario

4.2.1 The Legal Structure

As in the case of SPS measures, Nepal also has an obligation to reform its laws and regulations to be able to meet the provisions laid out in the “Agreement on Technical Barriers to Trade (TBT Agreement)” to ensure safety, quality, and environmental sustainability of exports and imports without creating unnecessary obstacles. In this

³⁴ Pandey et al. (2013).

context, Nepal has made important revisions and continues to revise existing laws—including the Nepal Standards Act—as well as drafting a new bill—the Accreditation Act.³⁵ The key legislations that encompass the TBT regulations in Nepal include the:

- (i) **Standard Measurement and Weight Act, 1968 (2025)** to maintain standards with regard to measurement and weights based on the metric system in Nepalese territory. It also specifies labelling requirements for packaged goods.
- (ii) **Nepal Standards (Certification Mark) Act, 1980 (2037) and Nepal Standards (Certification Mark) Rules, 1983 (2040)** to “make arrangements for determining the standard of any goods for the welfare of the public and for the use of the marks certifying the standards on such goods.”
- (iii) **Drugs Act, 1978 (2035) and Drugs Registration Regulation, 1981 (2038)** to protect human life and health from risks arising from misuse or abuse of drugs and allied pharmaceutical substances.
- (iv) **Export and Import (Control) Act, 1957 (2013) and Export and Import (Control) Rules, 1978 (2034)** to prohibit and restrict export and import for various reasons, including reasons related to TBT such as protecting national security interests, protecting the life or health of humans, protecting exhaustible natural resources and the environment, etc.
- (v) **Environment Protection Act, 1997 (2053) and Environment Protection Rules, 1997 (2054)** to protect the environment.
- (vi) **Consumer Protection Act, 1998 (2054) and Consumer Protection Rules, 1999 (2054)** to protect consumers from deceptive practices related to quality, quantity, and prices of consumer goods or services, including imports and exports. It prohibits certain practices (e.g., export or import of substandard goods, making false or misleading claims, sale of goods harmful to the health of consumers); lays out some labelling requirements; and lists the government’s power to conduct inquiries and inspections to prevent deceptive practices.

In addition to these TBT-related legislations, the **Trade Policy, 2015** and **Nepal Trade Integration Strategy, 2016** address various issues related to TBT constraints.

4.2.2 The Institutional Framework

4.2.2.1 Nepal Bureau of Standards and Metrology

The Nepal Bureau of Standards and Metrology (NBSM) under the Ministry of Industry is the apex government body for TBT-related issues. It also acts as the national TBT enquiry point and as the NTM focal point for the WTO. It plays an important role in overseeing the three important pillars of the WTO Agreement on Technical Barriers to Trade—technical regulations, standards, and conformity assessment procedures. The NBSM enforces the

³⁵ Deepak R. Pandey, Purna C. Wasti, and Gyanendra P. Mandal. 2013. *Country Presentation: Nepal*. Presentation prepared for the Brainstorming Meeting on Sanitary/Phytosanitary Priorities and Challenges in SASEC. Bangkok, Thailand, 24–25 November. <http://www.sasec.asia/uploads/events/2013/SPS-Nov2013/Country%20Presentation%20Nepal.pdf>; and Shankar P. Poudel, Megh Nath Timal, Sanjeev Kumar Thakur, Parbati Sharma, Sudeep Bajracharya, and Shyam Dahal. 2014. Status on SPS TBT. Presentation prepared for the Trade Facilitation Workshop on Sanitary/Phytosanitary and Technical Barriers to Trade. Bangkok, Thailand, 1–3 December. <https://www.sasec.asia/uploads/events/2014/tfweek-2014/nepal.pdf>.

fundamental TBT-related legislations: Standard Measurement and Weight Act, 1968 (2025) and the Nepal Standards (Certification) Mark Act 1980 (2037) and Rules 1983 (2040).

The major responsibilities and activities of the NBSM as the central TBT body of the country include formulating the Nepal standards (in compliance with international standards); authorizing the use of quality certification marks; providing system certification services (e.g., ISO 9000 Management System Certification and ISO 22000 Food Safety Management System); providing laboratory services for testing and certification; providing laboratory accreditation services; and providing calibration services. It has set the standards requirement for 888 products so far (following the guidelines of ISO and other internationally accepted standards) and has made the Nepal certification mark mandatory for importing 12 products into Nepalese territory.

While the NBSM oversees the formulation and enforcement of most TBT-related measures, its job is complemented by other government bodies, primarily the Department of Drug Administration (DDA), Ministry of Environment and Population, and the Ministry of Commerce.

4.2.2.2 Department of Drug Administration

The DDA under the Ministry of Health serves the important purpose of protecting human life and health from the risks arising from misuse or abuse of drugs. It is the government body responsible for enforcing the Drugs Act, 1978 (2035) and the Drugs Registration Regulation, 1981 (2038), and it oversees important TBT provisions related to drugs and allied pharmaceutical substances such as setting official standards for drugs, updating the Official Drugs Registry, and providing recommendation letters to exporters and importers. It also supervises the conformity assessment procedures by enforcing the certification requirement substantiating compliance with Good Manufacturing Practice (GMP) recommended by the World Health Organization (WHO).

4.2.2.3 Ministry of Population and Environment

The Ministry of Population and Environment is the apex government body for environmental protection and is thus associated with regulations that seek to make trade more environment-friendly. It enforces the Environment Protection Act, 1997 (2053) and the Environment Protection Rules, 1997 (2054). Some specific regulations that have come into effect for the protection of the environment include the Ozone Depleting Substances Consumption (Control) Rules, 2001 (2057) that prohibit the trade of certain ozone layer depleting chemicals; the Nepal Vehicle Mass Emission Standard, 2012 (2069) that lays out the standards for motor vehicles with regard to exhaust emissions as well as corresponding conformity assessment procedures; and a directive prohibiting plastic bags and sacks and sheets with a thickness of less than 20 microns, as well as prohibiting the imports of plastic waste and scraps.

4.2.2.4 Ministry of Supplies

The Ministry of Supplies is responsible for ensuring the supply of essential goods and commodities. It is also entrusted with safeguarding consumers against various deceptive

practices, which is also an important component of TBT measures.³⁶ It protects the rights and interests of consumers through the Consumer Protection Act, 1998 (2054) and the Consumer Protection Rules, 1999 (2056).

4.2.2.5 Ministry of Commerce

The Export and Import (Control) Act, 1957 (2013) and the Export and Import (Control) Rules, 1978 (2034) provide authority to the Ministry of Commerce to frame rules that regulate export and import for various national interests such as the protection of national security interests, protection of the life or health of humans, and protection of exhaustible natural resources and conservation of the environment. The Ministry of Commerce, through various directives published in the Nepal Gazette, thus established TBT-related measures such as the prohibition and restriction of narcotic and psychotropic drugs, prohibition and restriction on importing arms and ammunitions, maximum alcohol content requirement for noncommercial alcohol, and authorization requirement for imports in some sectors for TBT reasons. In addition to these institutions, the DFTQC also formulates and revises standards related to food that qualify as TBT.

4.2.3 Gap Analysis

The gap analysis for TBT on the identified potential export products for Nepal reveals the following inadequacies in standards, institutional frameworks, and infrastructure:

4.2.3.1 Gaps in Standards

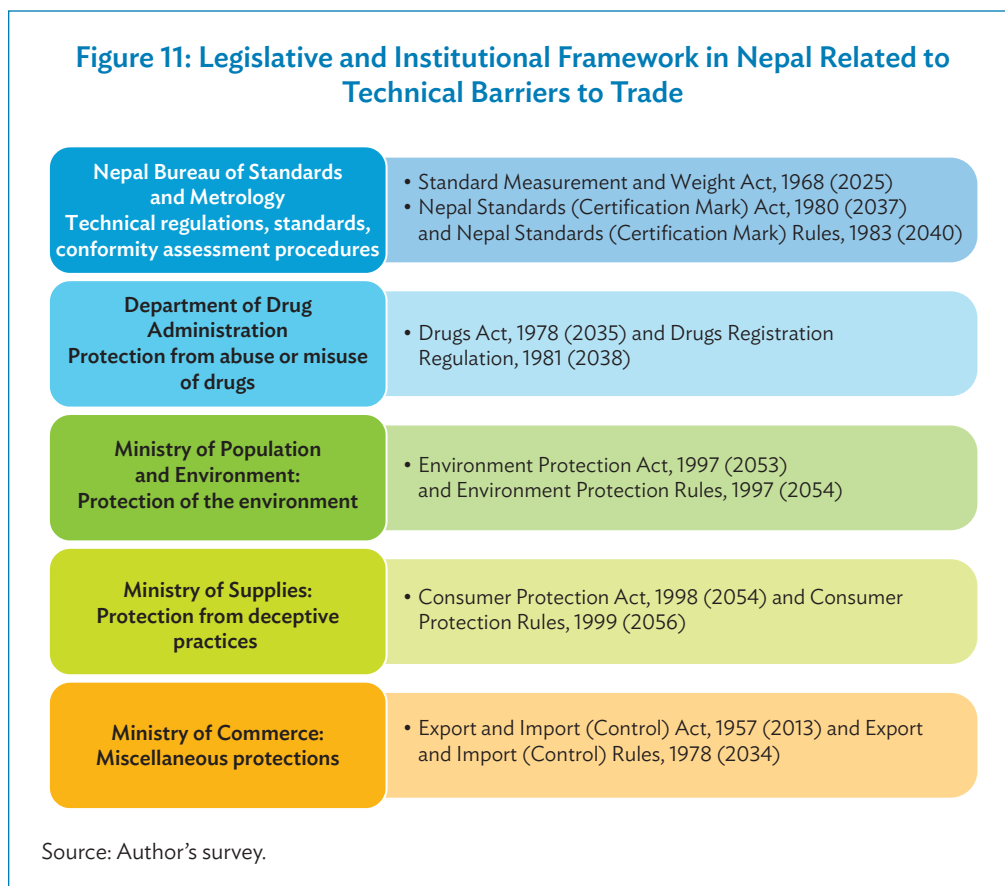

The NBSM has specified Nepal standards for 888 products (mostly based on ISO specifications) but only 12 products require mandatory compliance with the standards specified. Moreover, barring agricultural produce, food products, and pharmaceutical producers, none of the producers in Nepal must prove compliance with the standards developed. A significant majority of manufactured products are not subject to any process or production requirements such as GMP. While having too many mandatory standards could also be a major impediment, technical regulations requiring adherence to the minimum internationally accepted standards and regular market surveillance may be required to compel the producers to produce high quality products and innovate, and also to ensure safety and level of performance required of the products.

The most conspicuous gaps in standards are found in the following areas:

- (i) **Persistent organic pollutants.** Following the Stockholm Convention on Persistent Organic Pollutants, many international standards restrict or prohibit the trade of products that have the potential to be persistent organic pollutants because of their resistance to degradation and, hence, contribution to environmental degradation. Nepal has not regulated many such products through mandatory standards.

³⁶ Protection of human safety or health, protection of animal and plant life or health, and protection of the environment are other key objectives of TBT measures.

- (ii) **Endangered species protection.** Following the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES), the currently accepted international standards restrict or prohibit the trade of products comprising or containing specimens from the endangered plants and animal lists. Nepalese regulations related to CITES do not cover all the products.

- (iii) **Dangerous chemicals, pesticides, and biocides.** Following the Rotterdam Convention, the use of several dangerous pesticides and industrial chemicals is restricted or prohibited, covering a wide array of products. While Nepal has restricted or prohibited the use of several pesticides, it has not set standards to control dangerous chemicals and biocides for a variety of products.
- (iv) **Hazardous waste and their disposal.** Following the Basel Convention on the Control of Transboundary Movement of Hazardous Waste and Their Disposal, many international standards regulate the movements of potentially hazardous waste between nations. Nepal has yet to formally regulate the transboundary movement of hazardous waste.
- (v) **Basic technical standards.** Many products are subject to minimum performance requirements: for products intended for construction activities or the automotive

industry, for example, there are technical standards in place to ensure that important requirements such as mechanical resistance, stability, and other performance requirements, safety and accessibility requirements, energy economy requirements, and sustainability requirements are met. Nepal does not have such technical regulations for a large majority of products.

- (vi) **Labelling, packaging, and marking standards.** There is a lack of labelling, marking, and packaging requirements for non-food and non-pharmaceutical products.

The next section illustrates how the gaps in standards identified above lead to serious deviation from international best practice.

4.2.3.2 Deviation from International Best Practice

The overwhelming gaps in mandatory standards related to non-food and non-pharmaceutical products leave many Nepalese producers unable to meet strict international requirements. Furthermore, it leaves Nepalese borders open to substandard products. Tables 5–10 provide comparisons of product requirements between the EU and Nepal for a variety of products to illustrate the deviation from international best practice.

Table 5: Deviation from International Best Practice in Nepal: Soaps

Soaps (HS 340119)	
EU mandatory product requirements	Nepal's mandatory product requirements
Restriction/prohibition in use of certain chemicals	None
Labelling requirement for certain chemicals	

EU = European Union.

Note: These requirements extend to a variety of cosmetic products as well.

Source: EU trade desk (<http://trade.ec.europa.eu/tradehelp/>) for the EU requirements; author's compilation from various acts and policies for Nepal's requirements.

Table 6: Deviation from International Best Practice in Nepal: Rosin and Resin Acid

Rosin and resin acid (HS 380610)	
EU mandatory product requirements	Nepal's mandatory product requirements
Registration, Evaluation, Authorization, and Restriction of Chemicals:	None
(i) Registration requirements	
(ii) Evaluation: testing requirements	
(iii) Authorization requirements	
(iv) Restricted use of dangerous chemicals, pesticides, and biocides	

EU = European Union.

Source: EU trade desk (<http://trade.ec.europa.eu/tradehelp/>) for the EU requirements; author's compilation from various acts and policies for Nepal's requirements.

**Table 7: Deviation from International Best Practice in Nepal:
Plastic Articles**

Plates, sheets, film, foil and strip, of other plastics (HS 392119)	
EU mandatory product requirements	Nepal's mandatory product requirements
Restriction/prohibition of ozone-depleting products	None ^a
Specific requirements for packaging materials	

EU = European Union.

^a Although Nepal has banned the trade of ozone depleting materials, it has not done so for products containing or relying on ozone-depleting substances.

**Table 8: Deviation from International Best Practice in Nepal:
Textiles and Clothing**

Women's or girls' jackets and blazers, of wool or fine animal hair (HS 620431)	
EU mandatory product requirements	Nepal's mandatory product requirements
Prohibition on imports of skins of certain seal pulps	None
Restricted use of certain chemical substances in textile and leather products: (i) Tris (2,3 dibromopropyl) phosphate (ii) Tris (aziridiny) phosphin oxide (iii) Polybrominated biphenyls (PBB) (iv) Mercury compounds (v) Dioctyltin (DOT) compounds (vi) Nickel (vii) Azodyes (viii) Nonylphenol and nonylphenol ethoxylates (ix) Chromium VI compounds (x) Polycyclic aromatic hydrocarbons compounds	Prohibition on use of azodyes
Prohibited/restricted use of persistent organic pollutants and biocidal products	None
Labelling requirements for textiles	None
CITES (endangered species protection): Restriction/prohibition on imports of certain endangered species of animals and plants	None

CITES = Convention on International Trade in Endangered Species of Wild Fauna and Flora, EU = European Union.

Note: These requirements apply to other textile and leather products as well.

Source: EU trade desk (<http://trade.ec.europa.eu/tradehelp/>) for the EU requirements; Author's compilation from various acts and policies for Nepal's requirements.

**Table 9: Deviation from International Best Practice in Nepal:
Jewelry**

Silver jewelry, whether or not plated or clad with other precious metals (HS 711311)	
EU mandatory product requirements	Nepal's mandatory product requirements
General product safety requirements as per European Standards (CEN)	None
Prohibition on imports of skins of certain seal products	
Restriction on the use of certain chemical substances in jewelry products: Cadmium and its compound Nickel Lead and its compounds Polycyclic aromatic hydrocarbons compounds	
CITES (endangered species protection): Restriction/prohibition on imports of certain endangered species of animals and plants	

CITES = Convention on International Trade in Endangered Species of Wild Fauna and Flora, EU = European Union.

Note: These requirements apply to other jewelry products as well.

Source: EU trade desk (<http://trade.ec.europa.eu/tradehelp/>) for the EU requirements; Author's compilation from various acts and policies for Nepal's requirements.

**Table 10: Deviation from International Best Practice in Nepal:
Iron and Steel**

Flat rolled products of iron or non-alloy steel, of a width of 600 mm or more, plated or coated with corrugated zinc (HS 721041)	
EU mandatory product requirements	Nepal's mandatory product requirements
Prior EU surveillance for iron and steel products	None
Technical specifications for construction products: mechanical resistance and stability, safety requirements, energy economy requirements, and sustainability requirements	
Technical standards for motor vehicles (only required for products intended for the automotive industry)	

EU = European Union.

Note: These requirements apply to other construction products and products intended for automotive industry as well (HS 72–HS 83)

Source: EU trade desk (<http://trade.ec.europa.eu/tradehelp/>) for the EU requirements; Author's compilation from various acts and policies for Nepal's requirements.

The above gap analysis is indicative: when the gaps in other products are examined, the gaps in mandatory product requirements and deviation from international practice are present for virtually all products. Hence, a detailed analysis of product standards is required to amend the gap in standards and comply with international best practice.

4.2.3.3 Institutional Gaps

Weaknesses in the Nepal Standards (Certification Mark) Act, 1980 (2037) have resulted in an inadequate regulatory technical regime in Nepal to address the complex dynamics of the TBT scenario. The Nepal Standards (Certification Mark) Act, 1980 (2037) designates the NBSM as the regulatory authority for all different components of the TBT regime: standardization, conformity assessment, accreditation, and market monitoring. As the entire TBT process is controlled by a single institution, the overlap of regulatory and commercial functions coupled with the discretionary power of the institution to control the certification market creates significant conflict of interest and renders the TBT regime inefficient (Tippman 2013). The supposed best practices for national quality infrastructure, and hence the TBT regime by association, is a decentralized system with various bodies acting as legally autonomous units (Tippman 2013).

Another key institutional constraint is the lack of a national accreditation body that provides accreditation to the testing and calibration laboratories.³⁷ In the absence of an internationally recognized accreditation body, most laboratories have not been able to get accreditation. The government laboratories and few private laboratories that have been accredited by the NABL in India bear high financial and time costs, which has resulted in accreditation of only limited scope. This is a major impediment to the international recognition of testing and certification activities carried out in Nepal. An internationally recognized accredited body that can provide accreditation to the testing and calibration laboratories in a wide array of testing parameters is essential for easy compliance with international standards.³⁸

Similarly, the voluntary nature of the Nepal standards as per the Nepal Standards (Certification Mark) Act, 1980 (2037) and the Nepal Standards (Certification Mark) Rules, 1983 (2040), as well as the lack of technical regulations establishing minimum performance standards, safety standards, and environmental standards for a majority of products does not compel the producers to manufacture their products in compliance with internationally accepted standards. This leaves the majority of producers technologically unable to meet the rigorous product requirements of international markets. Thus, a new legislation requiring that products in the Nepalese market comply with the most basic international demands may be necessary.³⁹ This issue could also be resolved by creating a body that formulates mandatory standards for exports so that the distance to international standards does not act as a trade barrier. This could also be more pragmatic approach since many of

³⁷ The NBSM currently provides accreditation at a very low level, which is insufficient to become internationally recognized.

³⁸ The Accreditation Act has been drafted and is awaiting approval.

³⁹ As of the time of writing, a new Nepal Standards Act has been drafted and is awaiting endorsement. The legislation will hopefully address these concerns.

the technical requirements imposed in international markets may not be necessary for the domestic market.

Similarly, regulations governing labelling requirements are not found for non-food and non-pharmaceutical products produced in or entering Nepalese territory.⁴⁰ This means accurate information about the environmental and public health impacts of a very significant majority of products is withheld, and prevents consumers from making an informed choice. The lack of proper labelling regulations also opens the door for deceptive labelling and leaves the consumer susceptible to fraud.

Besides inadequate legislations and standards, the major institutional problems regarding TBT include insufficient legislative mechanisms for the protection of public health and safety; weak coordination and cooperation among institutions; inadequate systems and human resources capacity in terms of risk analysis, risk-based inspection, HACCP-based industry inspection, spot test, and so forth; and overall lack of human resources related to standardization and conformity assessment (Pandey et al. 2013; Poudel et al. 2014). Among many reasons for the lack of human resources at the NBSM, the inability to hire workers on demand and constant transfer of staff were cited as major constraints. As seen in the case of the DFTQC, the NBSM has also had almost the same number of staff throughout its 30 years of existence.

As it currently stands, the regulatory framework is gravely inadequate to address the environmental concerns, public health concerns, and deceptive practices. The regulatory deficiencies will most likely be addressed by the new Nepal Standards Act and Accreditation Act, but significant commitment and resources are required to properly implement these technical regulations and develop human resources to do so efficiently. Furthermore, the private sector, particularly small and medium-sized enterprises, needs support to be able to meet the standards.

4.2.3.4 Infrastructure Gaps

Even when manufacturers adhere to internationally accepted standards, their capacity to prove compliance with standards at the international level is severely affected by the lack of testing laboratories, metrology and calibration services, and certification bodies at both the private and public levels. Table 11 lists accredited TBT laboratories in Nepal and Table 12 shows the testing services offered that are not internationally accredited. A significant number of the responders of the survey of exporters conducted for this study also reported lack of laboratories and internationally accepted certification among the constraints they face.

In addition to the above-mentioned laboratories, a few private laboratories and nongovernment organizations are also providing testing facilities related to SPS measures and TBT (Table 13), which are, however, not accredited.

⁴⁰ Consumer Protection Act, 1998 (2054) and Consumer Protection Rules, 1999 (2056) do lay out some provisions related to labelling, but these requirements are rudimentary.

Table 11: Accredited Laboratories (Private and Public) Providing Testing Facilities Related to Technical Barriers to Trade in Nepal

Laboratory	Group of Products, Materials, or Items Tested	Specific Tests or Types of Tests Performed	Accreditation
Nepal Bureau of Standards and Metrology (NBSM)	GI wire	Mass of zinc coating, uniformity	National Accreditation Board for Testing and Calibration Laboratories (NABL) accredited according to ISO/IEC 17025-2005 requirements
	GI pipe	Mass of zinc coating, uniformity	
	Cement (ordinary Portland cement, Portland Pozzolana cement, Portland slag cement)	Loss of ignition, insoluble residues, silica (SiO ₂), calcium oxide (CaO), magnesia (MgO), alumina oxide (Al ₂ O ₃), iron oxide (Fe ₂ O ₃), sulfuric anhydride (SO ₃)	
	Fiber, yarns, fabric	Chemical composition (cotton, polyamide, polyester, wool, silk, viscose, elastane, acrylic)	
Zest Laboratories (P) Ltd.	Drugs and pharmaceuticals: albendazole tablets, amoxicillin, chloramphenicol capsules, ciprofloxacin HCl tablets, cotrimoxazole tabs, dihydroartemisinin, efavirenz; frusemide tablets, hyoscin butylbromide, isoniazide, lamivudine, metformin hydrochloride, metronidazole tablets; nevirapine; ofloxacin tablets; oral rehydration salt, paracetamol tablets, piperazine, tetraphosphate; tetracycline, tinidazole tablets, zinc sulfate	Average weight/volume, weight/volume variation, assay, dissolution, disintegration test, friability test, pH uniformity of content	NABL accredited according to ISO/IEC 17025-2005

Overall Poor National Quality Infrastructure

The national quality infrastructure (NQI)⁴¹ considered crucial for export competitiveness, has five main components: standardization, testing, metrology, certification, and accreditation. International recognition of the NQI is essential for eliminating TBT constraints as it helps exporters achieve the ultimate goal of “inspected once, tested once, certified once – accepted everywhere” (ITC 2011).⁴² However, it is evident from earlier discussions that Nepal’s quality infrastructure lacks maturity.

Given the lack of NQI to efficiently handle TBT issues, exporters resort to testing their products abroad to meet technical regulations, a procedure that significantly increases their financial and time costs. For example, ready-made garments exporters should have their products tested in India to prove that their manufactures satisfy the requirements related to azo-dye, lead, and metal, among others. Similarly, pharmaceutical products, if exported to India, are rerouted to a distant laboratory in Kolkata to determine if they

⁴¹ According to ITC (2011a), “national quality infrastructure (NQI) can be understood as the totality of the institutional framework (public or private) required to establish and implement standardization, metrology (scientific, industrial and legal), and the accreditation and conformity assessment services (inspection, testing, and product and system certification) necessary to provide acceptable evidence that products and services meet defined requirements, whether these are imposed by the authorities (in technical regulations and sanitary and phytosanitary measures) or the marketplace (i.e., contractually or inferred).”

⁴² International recognition of the NQI is equally important for eliminating SPS issues.

meet the necessary technical requirements. And silver jewelry exporters have to have their products tested abroad for tests related to cadmium content as well as silver assaying and hallmarking. One silver jewelry exporter reported that he stopped exporting to the United States because of a costly testing process in Hong Kong, China. He exports to Germany where the importer bears the cost and efforts to ensure that the technical requirements are met. Ceramic exporters also face TBT-related problems due to the lack of toxicity tests and testing facilities to test the quality of raw materials.

Thus, exporters are either bearing significant financial and time costs to meet the TBT requirements or only exporting to importers that fulfill the TBT requirements out of their own resources.

The infrastructure constraint will be especially severe once the importing countries make their standards mandatory for the imported products—that is, when they transform their current standards into technical regulations.

4.2.3.5 Procedural Obstacles

Similar to issues mentioned in the SPS gap analysis (Section 4.1.3), trade-impeding procedural obstacles commonly reported in Nepal regarding exports include the following: inconsistent manner in which procedures, regulations, and requirements are applied at customs because of lack of competent customs officials; excessive documentation requirements; substantial delays in obtaining authorization and approval; need to obtain approval from several entities; lengthy procedures causing substantial delays; and expectations of informal payments for many shipments.

This gap analysis reveals serious regulatory inadequacies to effectively address TBT issues in and for Nepal. Although there are some new and revised legislations in the pipeline, which are expected to address some of the current issues, substantial reforms are required to address other deep-rooted TBT issues such as lack of recognition of certification issued by Nepalese authorities, lack of adequate testing facilities, lack of human capital, and other procedural obstacles including arbitrary behavior of officials, delays related to reported regulation, informal payments, and so on.

4.3 Private Sector Capacity Constraints

Consultations with stakeholders for this diagnostic study also point to several capacity constraints related to the private sector that are responsible for SPS and TBT constraints:

- (i) The private sector can lack the capacity to promote their goods in a new market as companies have been generally found to be unaware of the potential of their goods being exported to certain SASEC countries.
- (ii) The private sector does not seem to be aware of the many testing facilities provided by the DFTQC and NBSM. One of the frequent complaints during the survey work carried out for this diagnostic study was that the test services needed by the private sector are not provided in Nepal, when in fact these tests

are offered by either the NBSM or DFTQC. Although the tests might not be internationally accredited, the NBSM claims that getting accreditation for the testing facilities they provide is not a complicated matter if enough requests are received.

- (iii) The private sector has not been contributing the necessary knowledge to the DFTQC and NBSM regarding the most important accredited testing facilities needed. NBSM authorities shared that getting accreditation for the services currently being provided is not an issue if sufficient volume of testing could be achieved. For example, the NBSM provides testing facilities related to azo-dyes, yet has a very limited number of clients and hence has not felt the need to get accredited for that particular testing service.

4.4 Summary of the Sanitary and Phytosanitary Measures and Technical Barriers to Trade Scenario

The gap analysis reveals a serious inadequacy in all facets of SPS and TBT superstructure: standardization, institutional settings, infrastructure status, and conformity assessment system. Box 2 provides information on the essential conformity assessment infrastructure to streamline SPS and TBT requirements, and Box 3 provides a description of basic international standards for SPS and TBT compliance. The gap study reveals that Nepal has serious deficiencies in all essential aspects of standards conformity infrastructure. Similarly, the absence of a national accreditation board has led to low penetration of the basic international standards noted in Box 3.

Box 2: Essential Standards Conformity Infrastructure

Basic international standards for proving compliance with sanitary and phytosanitary (SPS) and technical barriers to trade (TBT) requirements

The following international standards, and the corresponding certification, are becoming the norm for demonstrating compliance with SPS and TBT requirements:

ISO 9001 sets out the requirement for the quality management system (QMS). It ensures that the customers' quality demands are efficiently met and improved upon and regulatory requirements are effortlessly fulfilled. It adheres to the seven basic principles of quality management: customer focus, leadership, engagement of people, process approach, improvement, evidence-based decision, and relationship management.

ISO 14001 sets out the requirement for an environmental management system. It ensures that the environmental impacts are monitored, measured, and improved.

continued on next page

Box 2 continued

ISO 22000 attempts to harmonize the requirements for a food safety management system. It incorporates Good Hygienic Practice (GHP), Good Manufacturing Practice (GMP), Good Distribution Practice (GDP), and Hazard Analysis and Critical Control Points (HACCP), thus ensuring that the food safety hazards are controlled and that the delivered food is safe to consume.

ISO/IEC 17025 is the single most important international standard for calibration and testing laboratories. The adherence to this standard ensures that the laboratories are technically competent to produce consistent, precise, and accurate test results and/or calibration data. Getting certified for ISO/IEC 17025 by accreditation bodies that comply with ISO/IEC 17011 can result in greater acceptability of test results internationally and hence eliminate a burdensome trade barrier posed by duplication of testing requirements.

Source: UNIDO (2007) complemented by the descriptions provided by the ISO.

Box 3: Basic International Standards for Sanitary and Phytosanitary and Technical Barriers to Trade Compliance

Essential standards conformity infrastructure

The most basic and essential standards conformity infrastructure include the following:

- (i) A national standards institute to formulate, harmonize, and disseminate standards, including international ISO/IEC standards and for market surveillance for consumer protection.
- (ii) National microbiology and chemical testing laboratories providing credible testing services.
- (iii) A national metrology institute to establish measurement units and provide measurement traceability and testing for enterprises to assure precision manufacture and quality.
- (iv) A national certification capacity to certify enterprises for ISO 9001, ISO 14001, and ISO 22000; train internal auditors to carry out the audits; and ensure international acceptance of its certification.
- (v) A national accreditation board to accredit testing laboratories using ISO 17025, accredit certification bodies and inspection bodies, and have its own accreditation capabilities accepted internationally.

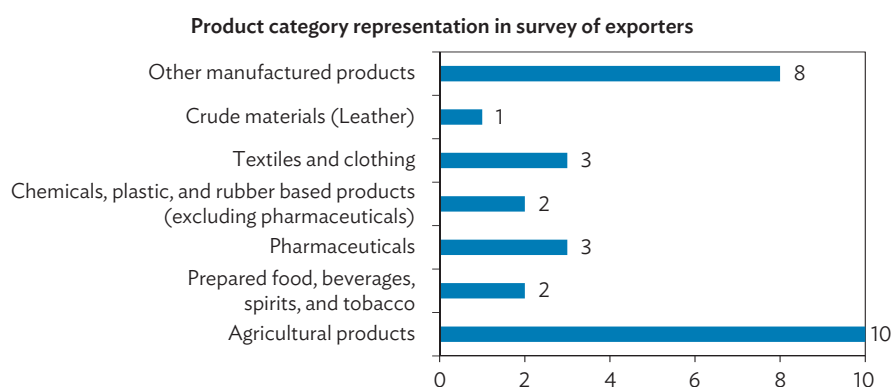

Source: UNIDO (2007).

Chapter 5

Standards, Regulations, and Procedural Obstacles That Impede Trade in SASEC Countries

Tables A3.1–A3.4 in Appendix 3 provide an overview of regulatory gaps that exist between Nepal’s standards and regulations and those of the other SASEC countries. To develop better insight on the standards, regulations, and procedural obstacles, this diagnostic study conducted a survey of 29 exporting firms or commodity associations.⁴³ Figure 12 illustrates the representation of different product categories in the survey.

Figure 12: Representation of Different Product Categories in the Survey of Exporters and Commodity Associations

Source: Author’s survey.

5.1. Impediments While Exporting to Bangladesh

Some of the discrepancies in standards and regulations and SPS measures and TBT that might impede trade are described below.

⁴³ Appendix 5 lists the name of firms and commodity associations that participated in the survey.

Radioactivity levels. According to Bangladesh’s Import Policy Order, 2012–2015,⁴⁴ Bangladesh has tolerance limits for radioactive levels (CS-137) for almost all edible products, except for cigarettes, spices, and alcoholic beverages. The issue of radioactivity is not addressed by Nepalese standards. The following products in the identified potential exports are affected by the radioactive requirements:

- (i) Meat of bovine animals; frozen; boneless (HS 020230)
- (ii) Fats and oils derived from milk (HS 040590)
- (iii) Other dried leguminous vegetables (HS 071390)
- (iv) Wheat flour (HS 110100)
- (v) Crude soya bean oil (HS 150710)
- (vi) Fixed vegetable fats and oil (HS 151590)
- (vii) Pasta (190230)
- (viii) Prepared foods obtained by the swelling or roasting of cereals or cereal products (HS 190410)
- (ix) Sweet biscuits (HS 190531)
- (x) Tomatoes prepared or preserved otherwise than by vinegar or acetic acid (excl. tomatoes, whole or in pieces) (HS 200290)
- (xi) Frozen orange juice (HS 200911)
- (xii) Mixtures of juices (HS 200990)
- (xiii) Other food preparations not elsewhere specified (HS 210690)
- (xiv) Bran, sharps, and other residues of cereals (excl. that of maize and wheat) (HS 230240)
- (xv) Oil cake and other solid residues, whether or not ground or in the form of pellets, resulting from the extraction of soya bean oil (HS 230400)
- (xvi) Oil cake and other solid residues of linseed (HS 230620)

According to the Import Policy Order, 2012–2015, Bangladesh waves this requirement for easily perishable foodstuff exported from a SAARC country, provided there is a certificate of origin and a certificate stating that the food is safe for human consumption. Some of the food products in the list as well as animal feed are still subject to the radioactivity test requirements.

Melamine. The Import Policy Order, 2015 stipulates that certain products be free of added melamine. The issue of melamine in food is not addressed by Nepalese standards. The following products are affected by this requirement:

- (i) Meat of bovine animals; frozen; boneless (HS 020230)
- (ii) Fats and oils derived from milk (HS 040590)
- (iii) Bran, sharps, and other residues of cereals (excl. that of maize and wheat) (HS 230240)
- (iv) Oil cake and other solid residues, whether or not ground or in the form of pellets, resulting from the extraction of soya bean oil (HS 230400)
- (v) Oil cake and other solid residues of linseed (HS 230620)

⁴⁴ The new Bangladesh import policy is governed by Bangladesh Import Policy Order 2015–2018, which does not yet have an English translation. However, most of the standards-related parameters mentioned here remain unchanged in the new policy document.

Antibiotics. According to the Import Policy Order, 2015, certain harmful antibiotics are prohibited in meat, meat products, and fish, poultry, and animal feed. The following products are affected by the specified requirement:

- (i) Meat of bovine animals; frozen; boneless (HS 020230)
- (ii) Bran, sharps, and other residues of cereals (excl. that of maize and wheat) (HS 230240)
- (iii) Oil cake and other solid residues, whether or not ground or in the form of pellets, resulting from the extraction of soya bean oil (HS 230400)
- (iv) Oil cake and other solid residues of linseed (HS 230620)

Hormonal treatment. The Import Policy Order, 2015 states that cows from which the milk originates must not have been given estrogenic hormones and hormone growth promotants (HGPs) treatment. Fats and oils derived from milk (HS 040590) are affected by this standard.

Box 4 summarizes the gaps in standards and regulations and SPS measures and TBT pertaining to identified potential exports from Nepal to Bangladesh.

Box 4: Some Gaps in Bangladesh and Nepalese Sanitary and Phytosanitary Standards and Regulations for Agricultural and Food Products

Provisions in Bangladesh sanitary and phytosanitary standards not addressed by Nepalese standards

General standards:

- Radioactivity levels: Limits for radioactive elements (CS-137) for the majority of edible items barring cigarette, alcoholic beverages, and spices.
Specific standards:
 - Melamine: Use of melamine prohibited in milk and milk products, meat and meat products, and fish, poultry, and animal feed.
 - Antibiotics: Presence of chloramphenicol and nitrofurantoin prohibited in meat as well as fish, poultry, and animal feed.
 - Hormonal treatment (milk and milk products): Cows from which the milk originates must not have been given estrogenic hormones and hormone growth promotants (HGPs) treatment.

Source: Nepalese legislations and gazette notices; Import Policy Order, 2012–2015; Raihan, Khan, and Quoreshi (2014)

Mandatory certification marks scheme. Some of the potential export items are subjected to the mandatory certification marks scheme of the Bangladesh Standards and Testing Institution (BSTI).⁴⁵ The following items among the potential products are subject to the mandatory certification marks requirement:

⁴⁵ See the Bangladesh Standards and Testing Institution website: <http://www.bsti.gov.bd/list.html>.

- (i) Fats and oils derived from milk (HS 040590): BDS CAC-A-2:2008
- (ii) Other spices (HS 091099): BDS 1205:2006 for curry powder
- (iii) Wheat flour (HS 110100): BDS 381:2007 for maida
- (iv) Crude soya bean oil (HS 150710): BDS 909:2000
- (v) Fixed vegetable fats and oil (HS 151590)
- (vi) Sweet biscuits (HS 190531): BDS 383:2001
- (vii) Tomatoes prepared or preserved otherwise than by vinegar or acetic acid (excl. tomatoes, whole or in pieces) (HS 200290): BDS 517:2002
- (viii) Frozen orange juice (HS 200911): BDS CAC 247:2008
- (ix) Mixtures of juices (HS 200990): BDS CAC 247:2008

Besides the SPS standards, regulations, and measures described above, there are some non-food products that should adhere to the technical regulations specified.

5.1.1 Technical Barriers to Trade Measures for Other Manufactured Products

5.1.1.1 Technical Specifications

BSTI specifies mandatory technical regulations for products. Compliance should be proven through a mandatory certification marks scheme. The following products in the list of potential exports to Bangladesh should adhere to BSTI technical specifications and certification marks:

- (i) Soap (HS 340119): BDS 13:2006, Amend 1:2008 for toilet soap.
- (ii) Glassware of a kind used for table of glass ceramic (HS 701310): BDS 485:2000 Amendment 1,2,3:2006
- (iii) Ballpoint pens (HS 960810): BDS 1384:2002

Waste and scrap. According to Bangladesh's Import Policy Order 2012–2015, the import of waste and scrap intended as industrial raw material is restricted, and only the recognized *bona fide* industrial unit shall be allowed to import these items. The potential export products affected by this requirement include the following:

- (i) Paper or paperboard, including unsorted waste and scrap (HS 470790)
- (ii) Waste and scrap of tinned iron or steel (HS 720430)

Special authorization requirement. Special authorization from the Bangladesh Telecommunication Regulatory Commission is required for the following potential export items:

- (i) Accumulator parts (HS 850790)
- (ii) Base stations (HS 851761)

5.1.1.2 Procedural Obstacles

Since the overwhelming share of exports to Bangladesh is dominated by one product—lentils (93.8% in 2016)—identifying other exporters who could give insight into the

procedural obstacles that the identified products might face proved challenging. However, the following procedural obstacles are frequently cited:

- (i) A radioactivity test is required for most of the edible food products in Bangladesh, and test reports from Nepal are not accepted.
- (ii) Inefficiency arising from inadequate human resources, insufficient power, and communication infrastructure at border posts create substantial procedural obstacles for the traders (Raihan, Khan, and Quoreshi 2014).

5.2. Impediments While Exporting to Bhutan

Major gaps in standards and regulations and SPS measures and TBT are not observed with respect to the Bhutanese market. In fact, Nepal already has SPS measures and TBT to ensure the quality of many food products that have not yet entered the regulatory framework of Bhutan. The only regulation that might impede trade of potential export product is the authorization requirement applicable to plastics and articles of plastic.⁴⁶

Since trade with Bhutan is also at a very low level, the study was able to identify only a few exporters with exporting experience to Bhutan. The only serious procedural obstacle they reported was substantial delays in obtaining authorization.

5.3. Impediments While Exporting to India

Appendix 4.3 provides existing gaps in standards and regulations and SPS measures and TBT between Nepal and India. It is evident from the gap analysis that India has more stringent SPS- and TBT-related requirements, especially for agricultural and food products, as well as clothing and textiles. Similarly, many exporters noted the rigorous conformity assessment procedures, particularly strict testing requirements causing substantial delays as a major impediment while exporting to India. Lastly, other procedural obstacles at the border pose a significant burden to Nepalese exporters.

5.3.1 Rigorous Sanitary and Phytosanitary and Technical Barriers to Trade Requirements

Rigorous SPS and TBT requirements for a variety of products, most particularly agricultural and food products, have posed some serious challenges to the exporters.

⁴⁶ A major caveat should be noted: analysis is based on the SPS and TBT database in Raihan, Khan, and Quoreshi (2014), which might not capture the entirety of the standards and regulations and other SPS measures and TBT in Bhutan. Certain standards and regulations might have been introduced or updated since this database was developed. This study recommends incorporation of the current standards and regulations from the Bhutanese national diagnostics study to update the gap analysis.

5.3.1.1 *Agricultural and Food Products*

Maximum limits for heavy metals content in all the different types of agricultural and food products are the same for both India and Nepal. However, there are many other parameters in Indian food standards that the Nepalese food standards have not considered. We list some examples of gaps in standards and regulations and SPS and TBT requirements related to the potential export products we have identified.

Frozen meat of swine (HS 020329). Besides basic animal health requirements and quarantine requirements, Nepal does not have mandatory standards for frozen meat of swine in many other parameters that India has specified. Some of the standards in meat not covered by the Nepalese standards are as follows:

- (i) Maximum levels of melamine for food products are set to 2.5 milligram per kilogram (mg/kg) in India (also the level set by Codex).
- (ii) There are maximum limits for naturally occurring toxic substance in food (maximum saffrole content not more than 10 parts per million in case of meat).
- (iii) Irradiated meat shall be radiated within the specified dose limits and packaged using appropriate materials. Irradiated meat must conform to the labelling requirements as well, and special authorization is required to import irradiated foods. There are no standards for irradiated food products in Nepal.
- (iv) Meat is subject to maximum levels of aldrin and dieldrin (0.2 mg/kg) in India.

Cheese (HS 040690). Maximum limits for metal contaminants are identical and, except for the maximum level of dichlorodiphenyltrichloroethane (DDT: 0.02 mg/kg in Nepal vs. 0.05 mg/kg in India) and the maximum level of phorate (0.01 mg/kg in Nepal vs. 0.05 mg/kg in India), maximum levels for other pesticide residues are identical as well. However, Nepalese food standards for cheese as well as other dairy products do not address the maximum levels for melamine.

Vegetable fats and oils, partly or wholly hydrogenated (HS 151620). Nepalese food standards do not address the following parameters addressed by the Indian food standards:

- (i) Maximum levels for melamine.
- (ii) Maximum limits for some pesticides: phenthoate and phorate.
- (iii) Labelling requirements: declaration of total trans-fat content and total saturated fat content.

Sugar confectionery not containing cocoa (HS 170490). Nepalese food standards related to food confectionery do not address the following parameters:

- (i) Maximum levels for melamine
- (ii) Maximum levels for naturally occurring toxic substances: hydrocyanic acid

Besides the gaps in standards and regulations illustrated by the examples above, the Indian food standards regulate the use of GMOs as well. Furthermore, their standards for food contact materials and labelling requirements are rigorous.

Box 5 offers a summary of major SPS and TBT gaps in Nepalese agricultural and food product standards and regulations in relation to Indian standards. The challenge posed by meeting these requirements is exacerbated by the fact that many of these tests must be conducted in Indian laboratories, which are significantly far from the Indian borders.

Medicaments containing antibiotics (HS 300320). Although there are no apparent gaps in standards between India and Nepal when it comes to pharmaceutical products as Nepal has set high standards for pharmaceuticals requiring adherence to WHO-GMP, exporters are nonetheless constrained by TBT requirements. First, exporters are reluctant to pay the high cost associated with registration of the firm in India and registration requirements for each product they aspire to export. The inspection requirement, whereby Indian importers must inspect the exporting industry, also comes with a significant cost. Even after the inspection and registration requirements are successfully completed, the shipments must undergo rigorous testing requirements in the Indian laboratory, which causes significant delays. All relevant exporters mentioned that there is no guarantee that the products will be allowed entry even after fulfilling the testing requirements, citing other concerns and implying protectionist intent.

Box 5: Major Gaps between Nepalese and Indian Standards and Regulations for Agricultural and Food Products

Major parameters in Indian food standards not covered by Nepalese food standards

General standards:

- Melamine: restricted presence of melamine in all food products (maximum level: 2.5 mg/kg)
- Steviol glycoside: restricted use of steviol glycoside in food products
- Naturally occurring toxic substances: maximum levels for naturally occurring toxic substances, such as agaric acid, hydrocyanic acid, hypericine, and saffrole
- Food contact materials (FCMs): regulations regarding suitable FCMs
- Genetically modified organisms (GMOs): special authorization requirement and labelling requirements for presence of GMOs
- Irradiated food: special authorization requirement, labelling requirements, and irradiation doses limit for irradiated foods
- Strict labelling requirements

Specific standards:

- Aldrin and dieldrin: maximum level set for aldrin and dieldrin in meat
- Maximum residue limit for pesticide residues: maximum residue limit for some pesticides in some food products (e.g., vegetable fats and oils) not addressed by Nepalese standards
- Labelling requirement: declaration of total trans-fat content and total saturated fat content (edible fats, oils, and processed and packaged foods with declared shelf-life)

Sources: Nepalese legislations and gazette notices; ITC's Market Access Map (<http://www.macmap.org/QuickSearch/FindNtm/FindNtm.aspx>).

Textiles and clothing (HS 50–HS 63). India requires a preshipment certificate stating that textiles and clothing products do not contain any hazardous dyes. In the absence of a laboratory in Nepal accredited by the NABL, the consignment will be cleared only after a sample is tested and certified by the NABL-accredited laboratory in Kolkata. This requirement has proven very burdensome for exporters. Furthermore, for some products that contain specimens from certain species of animals (e.g., woolen jerseys [HS 611011]), registration and authorization requirements apply.

5.3.1.2 Other Manufactured Products

Some of the noteworthy TBT measures imposed by India that do not have corresponding mandatory technical regulations in Nepal are the following:

- (i) **Mandatory technical specifications.** Wire of aluminum (HS 760519) and stranded wires, cables, ropes, and similar articles, of aluminum (HS 761490) require conformity with Indian technical standards through Electrical Wires, Cables, Appliances and Protection Devices and Accessories (Quality Control) Order, 2003.
- (ii) **Hazardous waste.** TBT regulations on production processes apply to certain products that could generate hazardous waste. The products affected are base stations of apparatus for the transmission or reception of voice, images, or other data (HS 851761), and ballpoint pens (HS 960810). They are also subject to the authorization requirements for TBT reasons. Furthermore, base stations are subject to further requirements, processing history and traceability requirements.
- (iii) **CITES Convention.** Registration requirements, authorization requirements, and specific labelling requirements apply to certain products that might contain endangered species of plants and animals. These requirements are imposed through the Wildlife (protection) Amendment Bill, 2013, which implements the CITES Convention. Affected products include violins and other string musical instruments played with a bow (HS 920210), and original sculptures and statuary, in any material (HS 970300).

Besides these gaps in standards and regulations, all the other potential export products are subject to rigorous labelling, packaging, and marking requirements.

5.3.1.3 Major Procedural Obstacles

Exporters reported conformity assessment procedures and the procedural obstacles associated with conformity assessment as an even greater impediment to exporting products to India than meeting SPS and TBT requirements. Some of the major procedural obstacles are as follows:

Extremely strict testing requirements. Almost all the exporters participating in the survey for this study who export to India or who had experiences exporting to India cited extremely strict testing requirements as a major obstacle while exporting to India, particularly in

agricultural and food products, and textiles and clothing. Testing requirements are carried out in a laboratory at significant distance to all the major Indian customs checkpoints, which is especially problematic for exporters of perishable products. Some exporters complained that even fulfilling the testing requirements does not guarantee entry of their products into India. Unsatisfactory test results or some other reasons are cited for refusing entry. Box 6 provides a case story of an exporter in Nepal who had to discontinue exports to India because of the SPS and TBT constraints posed by this extremely strict, detailed, and redundant testing requirement.

Box 6: Procedural Obstacles at the Indian Border Created by Sanitary and Phytosanitary and Technical Barriers to Trade Requirements

Sujal Foods Pvt. Ltd., the biggest sugar confectionery maker in Nepal, identified SPS issues and related procedural obstacles as the biggest export constraints facing them. They have experience exporting to Australia, Bhutan, the People's Republic of China (PRC), India, the United Kingdom, and the United States, with the PRC being their biggest export partner.

They identify India as a lucrative market for their products but have not been able to export significantly because of SPS barriers. For example, the Department of Food Technology and Quality Control does not have the required testing facilities for pesticide residue, antibiotics, radiations, and heavy metals.

Furthermore, despite being certified for ISO 22000:2005 (international food safety management system), the company face harassment at the borders. In addition to having to make informal payments, their biggest problem is that every shipment has to undergo testing requirements at a distant laboratory in Kolkata, which takes around 15–21 days. Besides being time-consuming and hindering timely deliveries, this extensive duration is even more problematic given the limited shelf time of these products.

To address the issues of testing requirements, the company has undertaken an ambitious initiative to build their own internationally accredited private laboratory – accredited by the National Accreditation Board for Testing and Calibration Laboratories (NABL). Although the company believes this will mitigate SPS constraints and could increase exports worldwide, it still has significant doubts that this will suffice to gain access to the lucrative Indian market as other procedural obstacles may be applied to deny entry of goods.

In the survey, the company strongly suggested eliminating SPS and TBT barriers to export by establishing state-of-the-art testing laboratories through private initiatives rather than through government involvement. Private efforts over several years to upgrade and establish internationally accredited laboratories through government initiatives have not yielded many positive results.

Furthermore, to remove SPS barriers with regard to the South Asia Subregional Economic Cooperation region, especially to gain access to the Indian market, strong political commitments to reduce procedural obstacles and through vehicles such as a mutual recognition agreement (MRA) is essential.

Source: Author's survey of exporter entities.

Arbitrariness of behavior. Almost all exporters surveyed reported arbitrary behavior of customs officials, citing the way procedures, regulations, or requirements are applied is inconsistent. The same products are expected to adhere to different requirements at different times and different customs points. This modus operandi can be viewed as having protectionist intents.

Informal payment. Although not a severe constraint, the exporters stated that almost all shipments require some informal payment on both the Nepalese side and the Indian side for clearance.

Inconsistent classification of products. The ginger exporters surveyed for this study reported that Indian customs officers coerce traders to classify fresh ginger as dried ginger. Fresh ginger (HS 09101010) does not have any goods and services tax (GST) attached to it, whereas dried ginger (HS 09101020, HS 09101030) incurs a GST of 5%. Since it is not a difficult process to distinguish fresh ginger from dried ginger, this type of misclassification poses a significant cost to traders and is a clear instance of regulatory violation creating obstacles for traders.

5.4. Impediments While Exporting to Maldives

The absence of English translations of technical regulations in Maldives meant that this study was unable to identify major gaps in standards and regulations for the identified potential export products to Maldives. Furthermore, as the trade between Nepal and Maldives is virtually nonexistent (Table A1.4 in Appendix 1) and hence no firm regularly exports to Maldives, procedural obstacles while exporting to Maldives could not be uncovered through the survey.

5.5. Impediments While Exporting to Sri Lanka

The following discrepancies in the standards and regulations, and SPS measures and TBT have the potential of impeding Nepal's potential exports to Sri Lanka:

Irradiation regulations. Sri Lanka's Food (Irradiation) Regulations, 2005 specifies labelling requirements and minimum and maximum doses of irradiation. It also specifies that the irradiation activities only be carried out by competent food operators authorized by competent national authority for food irradiation. According to regulations, the importation of irradiated foods should be accompanied by the following documents: "(a) proper labelling documentation; (b) documentation that Food Irradiation Facility concerned is duly licensed; (c) a certificate by the competent authorities of the country of origin, to the effect that the food has been inspected by them." The following potential exports to Sri Lanka are affected:

- (i) Meat of bovine animals, frozen, boneless (HS 020230)
- (ii) Cinnamon (*Cinnamomum zeylanicum Blume*) excl. crushed and ground (HS 090611)
- (iii) Big cardamon (Alaichi), neither crushed nor ground (HS 090831)
- (iv) Ginger, fresh, neither crushed nor ground (HS 091011)
- (v) Spices, not elsewhere specified (HS 091099)

Genetically modified organisms. The Food (Control of Import, Labelling and Sale of Genetically Modified Foods) Regulations regulate the import of genetically modified foods. Any GMOs as food or any food containing or consisting of GMOs or ingredients have to fulfill the requirements pertaining to sufficient labelling, special authorization, and control of sales.

Food contact materials. Food (Packaging Materials and Articles) Regulations 2010 regulates the use of packaging materials to prevent alteration or deterioration of food from potential contact with the packaging materials. For example, use of vinyl chloride plastics, articles made of enamel, or glazed earthenware are restricted.

Rigorous labelling requirements. The Food (Labelling and Advertising) Regulations 2005 lay out a series of labelling requirements for packaged foods that go beyond the ones specified by Nepal's Food Act.

5.5.1 Mandatory Sri Lanka Standards

The following products, through what is known as the Sri Lanka Standards (SLS) marks scheme, in accordance with the Imports (Standardization and Quality Control) Regulations, 2013 require conformity with Sri Lanka standards and require a mandatory SLS mark:⁴⁷

- (i) Mixtures of juices, unfermented and not spirited (HS 200990): SLS 729.
- (ii) Tubes, pipes and hollow profiles, welded, of circular cross-section, of iron or non-alloy steel (HS 730630): SL 829 related to galvanized steel pipes and sockets.
- (iii) Table, kitchen or other household articles and parts thereof; pot scourers and scouring or polishing pads, gloves and the like, of aluminum (HS 761510): SLS 69 related to wrought aluminum utensils-aluminum tableware and kitchenware.
- (iv) Electric conductors, for a voltage exceeding 1000 V (HS 854460): SLS 987 specification for PVC insulated electric cables 600/1000 V.

5.5.2 Special Provisions for Cosmetic Products

The Cosmetics Regulations (No. 38 of 1984) specify several requirements for importing cosmetic products. According to the regulations, cosmetics-related products can be imported only against registration of the product. Furthermore, testing requirements apply to prove safety, quality, and efficacy of the product. In addition to these requirements,

⁴⁷ The list of products under SLS marks scheme can be found here: <http://www.gic.gov.lk/gic/pdf/mandatorystandards-sls.pdf>.

special labelling requirements apply to the container of these products. The following potential export products are affected by this regulation:

- (i) Preparation for use on the hair (excl. shampoos, preps for permanent waving or straightening and hair lacquers) (HS 330590)
- (ii) “Agarbatti” and other odoriferous preparations, which operate by burning (HS 330741)

5.5.3 Other Regulations Regarding Environmental Protection

As provisioned by the National Environmental (Protection and Quality) Regulations, No. 1 of 2008, the following products require special authorization requirement as well as registration requirement for TBT reasons because of the concerns over their impact on the environment:

- (i) Coloring matter of vegetable or animal origin incl. dye extracts (excl. animal black), whether or not chemically defined (HS 320300)
- (ii) Floor coverings of plastics, whether or not self-adhesive, in rolls or in the form of tiles; wall or ceiling coverings of plastics (polymers of vinyl chloride) (HS 391810)
- (iii) Paper or paperboard, including unsorted waste and scrap (HS 470790)
- (iv) Carpets and other textile floor coverings, tufted, of other artificial textile materials (excl. wool or fine animal hair and nylon or other polyamides) (HS 570330)
- (v) Base stations of apparatus for the transmission or reception of voice, images or other data (HS 851761). This product is also subject to the authorization and registration requirement related to wireless telegraphy.
- (vi) Copper wire (HS 854411)
- (vii) Electric conductors, for a voltage exceeding 1000 V (HS 854460)

5.5.4 Procedural Obstacles

As in the cases for Bangladesh, Bhutan, and Maldives, Nepal does not export significantly to Sri Lanka, and the study was limited in its ability to identify exporters with trade to Sri Lanka. Only one of the survey responders occasionally exports handicraft products to Sri Lanka and did not report any procedural obstacles. However, in a series on nontariff measures in Sri Lanka, ITC (2011b), through an extensive survey of importers, mentions the following as the major procedural obstacles:

- (i) **Certification and testing issues.** Cosmetics, devices, and drugs import incur delays (up to 6 months), costs, and also difficulties in providing appropriate samples or repetitive testing of every shipment in order to get Sri Lanka Standards Institution certification.
- (ii) **Excessive inspection requirement.** According to the importers, imported goods are excessively inspected. The inspection requirement is noticeably excessive for products containing chemicals, jewelry, and electronics.
- (iii) **Substantial delays in administrative procedures.** Such delays were found to be the most significant procedural obstacle. The agencies contributing

to administrative delays were identified as Customs, Ministry of Defense, Chamber of Commerce, Ministry of Health, Sri Lanka Standards Institution, Port Authorities, Department of Inland Revenue, Ministry of Finance, and Ceylon Petroleum Corporation.

- (iv) **Arbitrary or inconsistent behavior of officials.** Inconsistent or arbitrary behavior of officials at Customs, National Gem and Jewellery Authority, Department of Commerce, Customs, Telecommunication Regulatory Commission, and Port Authorities were also reported as a significant procedural obstacle.
- (v) **Informal payments.** Informal payments—for example, demanded by customs and port authorities to clear shipment—were also commonly reported.
- (vi) Some importers also reported the following procedural obstacles: inconsistent classification of products, low security level for persons and goods, unusually high fees and charges, limited and inappropriate facilities, technological constraints, and a large number of different documents.

5.6 Lack of Information about the Market: A Common Problem

In addition to SPS and TBT issues created by different standards and regulations and procedural obstacles, lack of information about the market can be seen as a major reason for not exporting certain products to SASEC countries. Many exporters assume that their products are not demanded or desired in the SASEC market, when the data for this diagnostic study clearly indicates that these products have significant potential as exports to certain SASEC markets.

Lack of information about the SASEC market is also one of the reasons for lack of exports of identified products that do not yet incur any SPS and TBT requirements. For example, rosin and resin acid and derivatives (HS 380610) do not appear to attract any TBT requirements in either Bangladesh or Sri Lanka. During the survey, an exporter mentioned that he had no knowledge of the fact that these products could be exported to Bangladesh or Sri Lanka, and because of this lack of information, the exporter had been exporting the product only to India.

Besides information deficiency about the market, most of the surveyed exporters also had limited knowledge about SPS and TBT requirements of other SASEC countries. The lack of such knowledge is exacerbated by the absence of national or regional agencies providing information regarding SPS and TBT measures, rules, and regulations in the SASEC countries.

Chapter 6

Prioritized Recommendations for Action

Section 6 lays out prioritized practical recommendations for the public and private sectors, including key institutional and regulatory reforms in the areas of SPS and TBT, together with measures to (i) enhance coordinated institutional frameworks and build essential capacity and skills in the areas of SPS measures and TBT; (ii) reduce procedural obstacles and develop mutual recognition agreements (MRAs); (iv) identify gaps and upgrade SPS and TBT-related infrastructure; and (v) reduce the information gap facing both public and private sectors in SPS measures and TBT.

It further proposes country-specific recommendations designed to more effectively promote the export of the products identified throughout this diagnostic study as having potential for increased export to other SASEC countries. A list of potential sources of technical assistance and investment funding to draw upon in implementing the proposed recommendations is provided at the end of Section 6.

6.1 Implement Key Institutional and Regulatory Reforms

6.1.1 Sanitary and Phytosanitary

- (i) Implement a systems approach to incorporate GAP, GMP, and HACCP, and ensure traceability requirements are met.
- (ii) Adopt a risk-based preventive approach to food safety.
- (iii) Focus on food safety parameters while formulating technical regulations as current technical regulations emphasize food *quality* rather than food *safety*.
- (iv) Update and harmonize the SPS requirements with international standards in the Food Act.
- (v) Enhance institutional capacity to conduct pest risk analysis and implement integrated pest management.
- (vi) Increase institutional capacity for food surveillance.
- (vii) Allow SPS agencies to hire workers on demand and prevent constant transfer and rotations of employees.

6.1.2 Technical Barriers to Trade

- (i) Develop the regulatory framework to establish an accreditation body.
- (ii) Develop the regulatory framework for a national quality policy.

- (iii) Develop the regulatory framework to establish separate autonomous bodies for standardization, conformity assessment, accreditation, market surveillance, and evaluation.
- (iv) Develop the regulatory framework for a better technical regulations regime (e.g., mandatory standards for exports).
- (v) Allow the NBSM to hire workers on demand and prevent constant transfer and rotations of employees.

6.2 Accelerate Endorsement of New Legislation

Although there are plans for expected new legislation to reduce gaps in standards and regulations with international best practices (e.g., Food Act, Accreditation Bill, and Standards Act), government endorsement has been very slow. Approval of the necessary new legislation should pave the way to (i) creating a regulatory and supporting environment for “farm to fork” traceability; (ii) making HACCP, GAP, and GMP mandatory; and (iii) ensuring that global best practice in TBT is mandated in Nepal.

In addition to regulatory reforms, there is need for both the public and private sector to develop a conducive atmosphere for the correct and comprehensive implementation of rules and regulations affecting SPS measures and TBT through training of the SPS and TBT-related workforce, technical support, increasing awareness, knowledge sharing, and others.

6.3 Harmonize Standards

The gap analysis of the report reveals discrepancies in standards and regulations and other SPS measures and TBT between Nepal and other SASEC countries.⁴⁸

Furthermore, technical regulations developed by the respective SASEC countries that mandate certification mark schemes are expected to grow. Hence, harmonization of standards, at least for the products with major trade potential in the region, should be expedited. Although SAARC in 2011 established the South Asian Regional Standards Organization (SARSO), a special body to harmonize standards in the region and improve coordination in standardization and conformity assessment, progress has been slow,⁴⁹ with only three standards finalized by SARSO to date.⁵⁰

⁴⁸ Insufficient information is available for Bhutan and Maldives, and it has not been possible to identify comprehensive gaps in standards and regulations. Detailed analysis of the disparity in gaps between Nepal's standards and standards of SASEC countries as well as other international standards is highly likely to expose additional differences.

⁴⁹ More information about SARSO can be obtained at their website: <http://www.sarso.org.bd/#>.

⁵⁰ The approved SARSO standards are the Biscuits-specification (SARS 0006:2017), Refined Sugar-specification (SARS 0007:2017), and Code of Hygienic Practice for Dairy Industry (SARS 0008:2017).

6.4 Establish a National Accreditation Body

Many laboratories in Nepal face significant constraints in becoming certified for several testing and calibration parameters, which contributes significantly to the lack of recognition of testing certificates issued in Nepal by other countries. Establishing an internationally recognized national accreditation body, certified to issue accreditation to the laboratories is an urgent priority. Besides the most essential parameters such as microbiology and chemical testing, the national accreditation body must have the capacity to certify enterprises for the most basic international standards such as ISO 9001, ISO 14001, and ISO 22000.

6.5 Develop a National Quality Policy to Address Coordination Failures

One of the major SPS and TBT constraints reported by exporters as well as government agencies was the lack of coordination among different government agencies. Adding to this challenge was confusion created by a lack of clarity on which agency is responsible for certain actions. Thus, a national quality policy that clearly delineates the role of different government agencies could be instrumental in addressing coordination failures. Furthermore, such a policy could establish a decentralized system of national quality infrastructure.

6.6 Implement Targeted Human Resources Development

Poor implementation of SPS measures and TBT also contributes significantly to constraints. Research shows that the majority of procedural obstacles originate in Nepal itself, indicating a lack of necessary understanding in this area. Thus, proper strategy and training programs from the government as well as financial and technical assistance from international organizations are needed to transform and create a skilled SPS- and TBT-related workforce, including competent experts to expedite SPS and TBT standardization.

6.7 Enhance Sanitary and Phytosanitary Measures and Technical Barriers to Trade Diplomacy

Nepal's capacity for negotiations with trade partners as well as regional and international organizations is not at the desired level, which is a significant impediment to timely resolution of trade issues. Enhancing capacity for SPS and TBT diplomacy and proactively engaging with regional and international organizations and bilateral trade partners to

mitigate trade issues arising from SPS and TBT measures could play a crucial role in ensuring greater market access. Enhancing SPS and TBT diplomacy will also result in proper implementation of the WTO Agreement on the Application of Sanitary and Phytosanitary Measures (SPS Agreement) and the WTO Agreement on Technical Barriers to Trade (TBT Agreement), which could contribute significantly to removing SPS and TBT-related constraints.

One example where better coordination among government agencies can greatly enhance trade is demonstrated in a recently introduced initiative—the Single Window Interface for Facilitating Trade (SWIFT), launched in April 2016 by the Central Board of Excise and Customs, Government of India.⁵¹ SWIFT brings the Food Safety and Standards Authority of India, Drug Controller, Plant Quarantine, Animal Quarantine, Textile Committee, and Wild Life Crime Control Bureau under a single domain for import declarations, thus obviating the need for separate application forms required by different agencies. In addition to removing impediments caused by excessive documentation and the associated time and cost, this initiative is more important to Nepalese exporters as it commits to implementing policies of risk-based selective examination and testing rather than inspecting and testing every consignment. Nepal's Department of Customs could collaborate with the relevant agencies of the Government of India for implementation of SWIFT for Nepalese exporters. This would potentially greatly mitigate some of the major obstacles reported in the survey, including arbitrariness of behavior with regard to inspection, testing, and certification, as well as excessive inspection, testing, and certification requirements.

6.8 Reduce Procedural Obstacles: Development of Mutual Recognition Agreements

Harmonization of standards will resolve some issues related to gaps in standards and regulations, but major SPS and TBT issues will persist because of procedural obstacles such as lack of recognition of certification, excessive testing and inspection requirements, arbitrary behavior of officers, informal payments, and others. Estimates show that only 13% of all problems faced by exporters are induced by regulations being too strict, whereas an overwhelming 73% of NTMs pose difficulties for the exporters due to procedural obstacles, a significant number of which occur in Nepal (ITC 2016c). Both the measures and related procedural obstacles were estimated to be problematic for 14% of NTMs.

The survey conducted under the SASEC diagnostic study also revealed that exporters found more problematic procedural obstacles created by conformity assessment and other procedural obstacles such as arbitrary and inconsistent behavior, informal payments, and so forth. Importers in Sri Lanka find various similar procedural obstacles to be burdensome, including delay in administrative procedures, excessive inspection, inconsistent or arbitrary behavior of officials, and informal payments (ITC 2011b). Likewise, inefficiency arising

⁵¹ More information about this initiative can be obtained at <https://www.icegate.gov.in/SWIFT/about-us.html>.

from inadequate human resources, insufficient power and communication infrastructure at border posts (Raihan, Khan, and Quoreshi 2014), and radioactivity testing requirements for most edible food products create their own procedural obstacles. Deeper investigation will likely reveal additional commonly reported procedural obstacles in Bangladesh that are found to be impeding trade in India and Sri Lanka—and the same situation applies for Bhutan and Maldives. Given these procedural obstacles, the development and implementation of mutual recognition agreements (MRAs) between Nepal and other SASEC countries, mostly for identified perishable foods, could greatly help overcome these procedural obstacles and streamline the flow of goods.⁵²

MRAs among SASEC countries could also be pursued through the SAARC Conformity Assessment Framework established by the “SAARC Agreement on Multilateral Arrangement on Recognition of Conformity Assessment” (MARCA).⁵³ The MARCA, which has now been ratified by all the members, aspires to eliminate technical barriers to trade and enhance market access within SAARC by facilitating mutual recognition of conformity assessment. As per the provisions of MARCA, Board for Conformity Assessment (BCA) has been established to oversee all the conformity assessment work of SARSO, including MRAs.

Box 7: Mutual Recognition Agreements and Arrangements

What is a mutual recognition agreement and what is its benefit?

A mutual recognition agreement (MRA) is a special type of mutual recognition. An MRA is a legally binding agreement between two (bilateral MRAs) or more governments (regional MRAs) that recognize the competencies of the specified conformity assessment bodies in the exporting nations with regard to conformity assessment procedures—testing, certification, and inspection—for specific products. It also acknowledges the competency of designated conformity assessment bodies in the exporting country with regard to their knowledge of the standards and technical regulations of the importing nation.

MRAs are believed to promote greater market access through precluding the need for testing and certification by the importing country.

How is it different from a mutual recognition arrangement?

While a mutual recognition agreement (MRA) is between governments, a mutual recognition arrangement (also abbreviated MRA) is between conformity assessment bodies. The latter is an

continued on next page

⁵² Article 6.3 of the WTO Technical Barriers to Trade (TBT) Agreement recommends the use of MRAs: “Members are encouraged, at the request of other Members, to be willing to enter into negotiations for the conclusion of agreements for the mutual recognition of results of each other’s conformity assessment procedures.” Furthermore, Article 6.1 states, “...Members shall ensure, whenever possible, that results of conformity assessment procedures in other Members are accepted, even when those procedures differ from their own, provided they are satisfied that those procedures offer an assurance of conformity with applicable technical regulations or standards equivalent to their own procedures.”

⁵³ http://saarc-sec.org/uploads/digital_library_document/26_Conformity_Assessment.pdf.

Box 7 continued

acknowledgment of competency of one conformity assessment body by another. While it could be a precursor to a mutual recognition agreement between governments, it is not legally binding as is the case in mutual recognition agreements between governments.

What are the preconditions for concluding an MRA?

Besides the mutual willingness among countries to eliminate the barriers associated with conformity assessment, there are only two broad requirements:

- adequate technical competence of the conformity assessment bodies in the exporting country in performing testing, certification, and inspection; and
- competent understanding of standards or technical regulations of importing country.

Is harmonization of standards necessary for concluding an MRA?

Traditional MRAs do not require the harmonization of standards or technical regulations between contracting member states. It merely requires that conformity assessment bodies of the exporting country have a competent understanding of the standards or technical regulations of the importing country. This is considered an advantage of MRAs as it allows for different rules, standards, and technical regulations, and hence avoids extremely difficult requirements of harmonization of standards and technical regulations.

What are the key challenges in the pursuit of MRAs?

MRAs are costly to negotiate, incurring significant costs in terms of time and human resources. According to Brito, Kauffman, and Pelkmans (2016), “substantial time (also of higher officials and even ministers) is needed to raise the political capital to support the MRA negotiations to mobilize the administration, to lobby legislatures and to gather the support from business.”

MRAs are also challenging to negotiate as they require countries to sacrifice significant regulatory powers. Countries are willing to sacrifice these regulatory powers only when the welfare gains are significant enough to offset the loss of regulatory power. This challenge is even bigger for the highly regulated sectors such as pharmaceuticals and chemicals.

MRAs are specially challenging for the least developed countries as they do not have the level of infrastructure and technical competency needed. Their capacity to negotiate MRAs is also weakened by their overall poor negotiating capacities that stem from lack of human, financial, and technical resources.

Source: Author’s research.

6.9 Upgrade Testing and Calibration Laboratories

The gap study conducted under this report as well as the survey of exporters identified the extremely poor state of SPS and TBT infrastructure in Nepal as a major constraint facing exporters. Currently, neither relevant government agencies nor private laboratories are accredited for all testing parameters, most particularly for chemical and microbiological tests. This has led to exporters having to fulfill testing requirements in foreign countries, thereby incurring substantial financial cost and time delays. Thus, the government, through

public–private enterprise and/or through assistance offered by several international organizations should take major steps to upgrade existing infrastructure and establish new laboratories as required.

As a first step, a comprehensive mapping of all SPS and TBT-related infrastructure should be conducted, detailing the nature and parameters of all testing laboratories, together with logistics information of use to the private sector. This type of close-up study will better inform potential public-private joint ventures where the gaps are and where future investment is likely to be sustainable.

6.10 Reduce the Information Gap

One of the main issues that came out of the survey of exporters was that the exporters have insufficient information about the markets in SASEC countries. They had wrongly assumed that there was no demand for their products in other SASEC countries. Thus, the export promoting authority in Nepal, the Trade and Export Promotion Centre, should play a more proactive role in identifying new markets in the SASEC region and promoting potential export products. Similarly, exporters' knowledge of the SPS and TBT requirements in other SASEC countries is minimal. Thus, the Ministry of Industry, Commerce & Supplies and concerned agencies such as the Trade and Export Promotion Centre should play a more active role in assisting the dissemination of information to exporters. The information gap could also be mitigated through setting up a regional trade portal containing updated information on SPS and TBT requirements in all the SASEC countries.

6.11 Country-Specific Prioritized Recommendations

Based on the findings of the Nepal SPS and TBT diagnostic study, country-specific prioritized recommendations for different product groups are proposed in this section. Some of the recommendations such as establishing accreditation bodies, formulating a national quality policy, and enhancing SPS and TBT diplomacy are applicable for all products and all countries. Hence, they are not included in the following tables. However, they too play an important role in eliminating the overall SPS and TBT constraints faced by Nepalese exporters.

Table 14: Prioritized Recommendations for Promoting the Export of Identified Potential Products for Bangladesh

Product Group	Prioritized Recommendations	Suggested Timing (2018–2019)
Agricultural products and prepared food, beverages, spirits, and tobacco	<p>Upgrade laboratories</p> <ul style="list-style-type: none"> • Upgrade laboratories and plant and animal quarantine check posts, including human resources, and disseminate information about the availability of testing facilities to exporters. • Get international/NABL accredited for essential safety parameters required in Bangladesh <ul style="list-style-type: none"> – Radioactivity tests for edible items^a – Veterinary drug residues test – Melamine tests in milk and milk products, meat and meat products, and animal feed – Pesticide residues test for vegetable products – Food contaminants/additives laboratory. 	2018–2019
	<p>Harmonize and update standards</p> <ul style="list-style-type: none"> • Formulate standards regarding fresh, chilled, or frozen meat (including maximum residue limits for harmful antibiotics) • Formulate standards for irradiated food • Update milk and dairy products’ standards to set maximum levels for melamine • Update milk and dairy products’ standards to ensure that cows must not have been given estrogenic hormones and hormone growth promotants (HGP) 	2018
	<p>Government-to-government/Institutional agreements</p> <ul style="list-style-type: none"> • Conclude a memorandum of understanding (MOU) between the NBSM and Bangladesh Standards and Testing Institution authorizing NBSM to issue Bangladesh Standards Certification for potential products under the mandatory scheme: fats and oils derived from milk (HS 040590), curry powder (HS 091099), wheat flour (HS 110100), crude soybean oil (HS 150710), fixed vegetable fats and oil (HS 151590), sweet biscuits (HS 190531), tomatoes prepared or preserved (HS 200290), frozen orange juice (HS 200911), mixtures of juices (HS 200990) • Conclude a mutual recognition agreement to reduce the trade-impeding constraints posed by excessive inspection, double testing, and double certification after the most essential parameters are internationally accredited. 	2019
	<p>Regulatory and institutional reform</p> <p>Regulatory reform to incorporate a systems approach, HACCP principles, traceability requirements, etc.^b</p> <p>Institutional reforms include the following:</p> <ul style="list-style-type: none"> • Increase institutional capacity to conduct pest risk analysis • Allow for more hiring, avoiding constant transfers, and regulatory capacity building. 	2018–2019
Chemicals, plastic, and rubber-based products ^c	<p>Upgrade laboratories</p> <ul style="list-style-type: none"> • Upgrade the National Medicine Laboratory to provide expedited services (for pharmaceutical products). • Get the National Medicine Laboratory accredited for common pharmaceutical exports. 	2018–2019

Table 14 continued

Product Group	Prioritized Recommendations	Suggested Timing (2018–2019)
	<ul style="list-style-type: none"> Disseminate information about the availability of testing facilities for certain pharmaceutical products to exporters such as the ones provided by Zest Laboratories. 	
	<p>Institutional reform</p> <ul style="list-style-type: none"> Enhance institutional capacity to conduct pest risk analysis as well as to implement integrated pest management for successful export of Ayurveda 	2018–2019
	<p>Disseminate information and promote potential products</p> <ul style="list-style-type: none"> Disseminate information about the Bangladesh market for potential pharmaceutical products, plastic products, and other miscellaneous chemical products like rosin, perfumery, cosmetics, etc., as many exporters are not aware of or have not explored the possibility of exporting them to Bangladesh. Promote the identified potential products through export promotion activities and through enhancing business partnership. 	2018
Textiles and clothing	<p>Disseminate information and promote potential products</p> <ul style="list-style-type: none"> Disseminate information about the Bangladesh market for textiles and clothing, as many exporters are not aware of this possibility, wrongly assuming that these products are not imported by Bangladesh. Promote the identified potential products through export promotion activities and through enhancing business partnership. 	2018
	<p>Upgrade laboratories</p> <ul style="list-style-type: none"> Upgrade the textile laboratory to provide accredited testing services for hazardous dyes (Azo dyes). 	2018–2019
Base metals and articles of base metal	<p>Disseminate information and promote potential products</p> <ul style="list-style-type: none"> Disseminate information about the Bangladesh market for silver jewelry and other imitation jewelry, as many exporters are not aware of this possibility, wrongly assuming that these products are not imported by Bangladesh. Promote the identified potential products through export promotion activities and through enhancing business partnership. 	2018
	<p>Upgrade laboratories</p> <ul style="list-style-type: none"> Upgrade the silver testing laboratory and get international accreditation for the most basic tests (e.g., cadmium, nickel, and hallmarking). 	2018–2019
Other manufactured products ^d	<ul style="list-style-type: none"> Conclude an MOU between the NBSM and Bangladesh Standards and Testing Institution authorizing NBSM to issue Bangladesh Standards Certification for potential products under the mandatory scheme: soap (HS 340119), glassware (HS 701310), ballpoint pens (HS 960810). Disseminate information and promote the identified potential products. 	2018–2019

NABL = National Accreditation Board for Testing and Calibration Laboratories, NBSM = Nepal Bureau of Standards and Metrology.

^a Until the accredited testing facility is available, the Department of Food Technology and Quality Control could issue a “Fit for Human Consumption” certificate for the potential products that require radioactivity testing, as countries of the South Asian Association for Regional Cooperation are allowed to replace radioactivity tests with such certificates according to the Bangladesh Import Policy Order, 2015–2018. The products affected are listed in Section 5.1 of the report.

^b Although traceability and Hazard Analysis and Critical Control Points (HACCP) requirements are not needed for potential exports to Bangladesh, these are reforms that will be needed to adapt to both the international standards and evolving South Asian standards.

^c Plastic products are not being exported in significant amounts and have declined mostly because of capacity constraints.

^d Although the report generally recommends upgrading the laboratories such as handicraft laboratories, electrical laboratories, and calibration laboratories for overall export promotion, these have not been recommended here as Bangladesh does not yet have any mandatory standards for most of the manufactured products in the potential export products for Bangladesh.

6.12 Potential Sources of Assistance

Given the complex nature of SPS and TBT constraints, the management of these issues requires substantial resources, technical support, and possible investment flows. Similarly, an active mechanism for knowledge sharing with the private sector would require engagement and assistance from private sector associations and commodity associations. It is likely that a least developed country such as Nepal will require support from bilateral and multilateral platforms as well as development partners and other competent local agencies to effectively deal with SPS and TBT constraints. Table 19 compiles sources of assistance that have been involved in SPS- and TBT-related projects in Nepal or that could be tapped as a valuable source of support and expertise.

Table 19: Existing and Potential Sources of Assistance

Chapter 7

Conclusion

Amid the background of insignificant trade between Nepal and SASEC countries—with the exception of India—and proliferating use of SPS and TBT standards and regulations worldwide, this report attempts to identify the main SPS and TBT constraints that might be impeding Nepal's exports to other SASEC countries. The first step was to identify products that Nepal exports substantially at the global level but insignificantly to other SASEC countries, even though these products are imported by other SASEC countries at less competitive prices from other countries. Then we looked at several sources to identify the SPS and TBT requirements as well as the associated procedural obstacles these products might face in the importing SASEC country.

We also looked at the state of quality infrastructure in Nepal that might be posing significant SPS and TBT constraints. Furthermore, we also looked at the gaps in standards and regulations and other SPS and TBT practices, while comparing them with international standards as well as with the practices of individual SASEC countries. Besides the gaps in infrastructure, standards, and regulations, the gap analysis also tried to uncover the key institutional deficiencies. We found substantial inadequacies in all the different aspects of SPS and TBT implementation: standardization, institutions, infrastructure, and human resources.

The gap analysis was then complemented with a survey of 29 exporters and commodity association representatives encompassing a wide array of products. The analysis as well as the survey of exporters found some significant gaps in SPS and TBT standards and regulations compared with those of other SASEC countries and also the presence of complex procedural obstacles.

The following key recommendations emerge from this study: establish and upgrade testing and calibration laboratories; establish a national accreditation body; harmonize standards among SASEC countries; establish MRAs for major perishable items; approve new legislation quickly; develop a skilled workforce; and share information about SASEC markets with Nepalese exporters. A major caveat, however, highlights the need for further research: little information is currently available about SPS and TBT regulations and associated procedural obstacles in Maldives, and the study findings are constrained by the lack of firms that have experience in exporting to Bangladesh, Bhutan, Maldives, and Sri Lanka.

Key Questions for Survey of Exporters

Survey of Exporters: Critical Questions

- (i) Which countries are major markets at present for Nepal?
- (ii) How does Nepal comply with the sanitary and phytosanitary (SPS) and technical barrier to trade (TBT) requirements of current export markets other than SASEC countries?
- (iii) What are the most important reasons for not exporting to a South Asia Subregional Economic Cooperation (SASEC) country (M)?
- (iv) Is information about market M available?
- (v) Is information on SPS-TBT in market M available?
- (vi) What are the problems associated with compliance of SPS-TBT in market M?
- (vii) Is conformity assessment (including testing, certification and inspection) available in Nepal?
- (viii) Which agency does the conformity assessment in Nepal?
- (ix) If conformity assessment is done in importing country M, where is the conformity assessment of products done to ensure compliance of SPS-TBT?
- (x) Can exporters in Nepal meet the demand of the SASEC importing country or do they face identified supply-side constraint as well?
- (xi) What kind of support do exporters need from their government to export the identified priority products?

Potential Exports and Nontariff Barriers to Trade

Nepal National Study

This publication explores how Nepal could boost its exports by addressing nontariff barriers to trade. It focuses on sanitary and phytosanitary measures and technical barriers to trade, and identifies export products that have potential for an increased market share in Bangladesh, Bhutan, India, Maldives, and Sri Lanka. It also examines the regulatory environment and demonstrates the need to upgrade quality standards and laboratory equipment, and strengthen accrediting and assessment bodies. The publication recommends how the public and private sectors can overcome these barriers.

About the South Asia Subregional Economic Cooperation Program

The South Asia Subregional Economic Cooperation (SASEC) program brings together Bangladesh, Bhutan, India, Maldives, Myanmar, Nepal, and Sri Lanka in a project-based partnership that aims to promote regional prosperity, improve economic opportunities, and build a better quality of life for the people of the subregion. SASEC countries share a common vision of boosting intraregional trade and cooperation in South Asia, while also developing connectivity and trade with Southeast Asia through Myanmar, to the People's Republic of China, and the global market.

About the Asian Development Bank

ADB is committed to achieving a prosperous, inclusive, resilient, and sustainable Asia and the Pacific, while sustaining its efforts to eradicate extreme poverty. Established in 1966, it is owned by 68 members —49 from the region. Its main instruments for helping its developing member countries are policy dialogue, loans, equity investments, guarantees, grants, and technical assistance.
