Entrepreneurial Intentions in Selected Southeast European Countries

Abstract:

Entrepreneurship has an increasingly important role in economic growth and development in both developed and underdeveloped countries. In order to explore entrepreneurial intentions and their antecedents in the post-transition context, we have conducted a survey among 1,200 students of economics and business in four Southeast European countries: Bosnia and Herzegovina, Croatia, Macedonia and Serbia. The following scales were included in the highly structured questionnaire: locus of control, risk taking propensity, perceived barriers, perceived support factors, personal attitude towards entrepreneurship, perceived behavioral control, subjective norm and entrepreneurial intention. Collected data were analyzed with multiple regression technique in order to explore the effects of various antecedents on entrepreneurial intention in the context of Southeast European countries. The results indicate that personal attitude towards entrepreneurship, perceived behavioral control and subjective norm positively and significantly affect entrepreneurial intent. Respondents from Bosnia and Herzegovina exhibit higher levels of entrepreneurial intent compared to other observed countries. The findings of our research provide better understanding of entrepreneurial intentions and their antecedents in the specific post-transition context of Southeast European countries. Theoretical and policy implications of the research findings are discussed in the paper.

Keywords: entrepreneurship, entrepreneurial intentions, survey, post-transition, Southeast Europe

JEL classification: L26

Poduzetničke namjere u odabranim zemljama jugoistočne Europe

Sažetak:

Poduzetništvo ima sve značajniju ulogu za ekonomski rast i razvoj u visokorazvijenim i slabije razvijenim zemljama. Kako bismo istražili poduzetničke namjere i njihove determinante u posttranzicijskim zemljama, u ovom je radu provedeno anketno ispitivanje 1.200 studenata ekonomije i poslovne ekonomije u četiri zemlje jugoistočne Europe: Bosni i Hercegovini, Hrvatskoj, Makedoniji i Srbiji. Korišten je visokostrukturirani upitnik koji je uključivao pitanja o stupnju kontrole, sklonosti preuzimanju rizika, percipiranim preprekama i poticajima, osobnim stavovima prema poduzetništvu, percipiranom ponašanju, subjektivnim normama i poduzetničkim namjerama. Prikupljeni podaci analizirani su metodom višestruke regresije kako bi se istražio učinak različitih determinanti na poduzetničke namjere u kontekstu zemalja jugoistočne Europe. Rezultati pokazuju da osobna sklonost poduzetništvu, percipirano ponašanje i subjektivne norme pozitivno i značajno utječu na poduzetničke namjere. Ispitanici iz Bosne i Hercegovine pokazuju veću razinu poduzetničkih namjera u usporedbi s ispitanicima iz drugih promatranih zemalja. Ovo istraživanje doprinosi boljem razumijevanju poduzetničkih namjera i njihovih determinanti u specifičnom posttranzicijskom okruženju zemalja jugoistočne Europe. U radu se raspravlja i o mogućim teorijskim implikacijama i preporukama za nositelje politike.

Ključne riječi: poduzetništvo, poduzetničke namjere, anketa, posttranzicija, jugoistočna Europa

JEL klasifikacija: L26

1 Introduction

Entrepreneurial activities have increasingly important roles in various aspects of economic and social development around the world. Therefore, it is not surprising that entrepreneurial behavior has received significant scholarly attention from various academic disciplines (e.g. Shane and Venkataraman, 2000; Busenitz et al, 2003; van Praag and Versloot, 2007; Shepherd and Williams, 2015).

Entrepreneurial intention is one of the rapidly evolving sub-fields within the broader field of entrepreneurship research (Linan and Fayolle, 2015). Pioneering works in this area were published by Shapero (1984) and Shapero and Sokol (1982). Since then, entrepreneurial intention framework has been tested, refined and employed by a number of studies (e.g. Krueger, Reilly and Carsrud, 2000; Luthje and Franke, 2003; Veciana, Aponte and Urbano, 2005; de Pillis and Reardon, 2007; Lee et al., 2011; Linan and Fayolle, 2015). Also, initial theoretical framework has been integrated with theories from the field of social psychology (Ajzen 1991; Bandura 1982).

Many previous studies explore the effects of various personal-level variables on entrepreneurial intention (e.g. Lee and Wong, 2004; Segal, Borgia and Schoenfeld, 2005; Linan and Santos, 2007). Numerous variables are analyzed in these studies as antecedents of entrepreneurial intention, such as demographics, personal traits and psychological variables, as well as prior entrepreneurial exposure and social capital. Another major stream of research includes studies that analyze various contextual variables (e.g. national, regional or cultural variables) as antecedents of entrepreneurial intention (e.g. Veciana, Aponte and Urbano, 2005; Engle et al., 2010). Also, some studies are more focused on various theoretical and methodological issues of the entrepreneurial intention model (e.g. Linan and Chen, 2009; Schlaegel and Koenig, 2014).

Our paper contributes to the entrepreneurial intention literature making the following advances. Our research combines three streams of research into one study. We explore the effects of personal-level and contextual variables on entrepreneurial intention. The basic model of planned behavior is extended with locus of control, risk taking propensity, perceived barriers and perceived support factors. Conducting our research in four Southeast European countries, we are using them as an empirical testing ground to explore the effects of national environments of these specific countries on entrepreneurial intent. And finally, we conduct an empirical test of Ajzen's theory of planned behavior and explore how well it explains the situation found in the post-transition setting.

Literature review is presented in the next section. Conceptual framework is presented and hypotheses are developed in the third section. The methodology is described in the fourth section, followed by the results and discussion section. The final section includes

conclusions with theoretical and policy implications, limitations and the lines for future research.

2 Literature Review

Entrepreneurial intention may be defined as the intention of an individual to start a new business (Krueger, 2009). It represents a mental orientation such as desire, wish and hope influencing an individual's choice of entrepreneurship (Peng, Lu and Kang, 2012). Intentions are considered the single best indicator of actual behavior (Ajzen, 1991) and entrepreneurial intentions are therefore central to better understanding entrepreneurial behavior in the process of discovering, creating and exploiting opportunities (Gartner, et al., 1994).

There are two main theoretical models of entrepreneurial intention. One of the earliest models of entrepreneurial intention is the entrepreneurial event model (Shapero, 1975; Shapero and Sokol, 1982; Krueger, 1993). Based on this model, entrepreneurial intention depends on three main antecedents: perceived desirability, propensity to act and perceived feasibility. Another important theoretical model of entrepreneurial intention is adopted from the field of social psychology. It is known as the theory of planned behavior. This theory was developed by Ajzen (1991) as a framework that might be applied to different behavioral contexts, and it was introduced to the entrepreneurial intention context by Krueger and Carsrud (1993). According to this model, the following variables affect entrepreneurial intention: attitude towards the entrepreneurship, subjective norm and perceived behavioral control. Additionally, there have also been efforts to extend the existing and develop new theoretical models of entrepreneurial intention (Davidsson, 1995; Krueger, Reilly and Carsrud, 2000; Elfving, Brannback and Carsrud, 2009) and to integrate them into a single, coherent model (Linan, Rodriguez-Cohard and Rueda-Cantuche, 2005; Shook and Bratianu, 2010; Schlaegel and Koenig, 2014; Langer et al., 2016). Nevertheless, the theory of planned behavior has been shown as more consistent in predicting entrepreneurial intentions and it is based on more coherent theoretical framework (Krueger, Reilly and Carsrud, 2000; Engle et al., 2010; Iakovleva, Kolvereid and Stephan, 2011).

The entire stream of research within the entrepreneurial intention field seeks to identify additional antecedents of entrepreneurial intention. Additional antecedents range from various personal-level variables to specific contextual variables. Indeed, the context matters and this might be more important for post-transition countries. Luthje and Franke (2003) added risk taking propensity and locus of control as additional personality variables to the model. Also, they included support and barriers as specific contextual variables. De Pillis and Reardon (2007) explored the effects of achievement motivation, tolerance for

ambiguity and personal efficacy on entrepreneurial intention as well as the effects of cultural contextual variables operationalized as face-to-face and mass media persuasion about entrepreneurship. Crant (1996) explored the effects of proactive personality and demographics on entrepreneurial intention. Segal, Borgia and Schoenfeld (2005) included risk perception into their analysis of entrepreneurial intentions, while Carr and Sequeira (2007) and Peng, Lu and Kang (2012) included prior entrepreneurial experience (personal and/or family).

Since the entrepreneurial intention can be strongly influenced by the contextual environment, numerous studies have explored the differences in entrepreneurial intention among different countries, regions and cultural groups. Veciana, Aponte and Urbano (2005) compared entrepreneurial intentions between Catalonia and Puerto Rico, which might have shared cultural tradition but different economic models. Kristiansen and Indarti (2004) conducted a comparison between Norway and Indonesia, which have both different cultural traditions and economic models. Engle et al. (2010) conducted an analysis of entrepreneurial intention among 12 countries representing 10 regional cultural clusters, while Iakovleva, Kolvereid and Stephan (2011) conducted a comparison among 13 countries focusing on the differences among developed and developing countries.

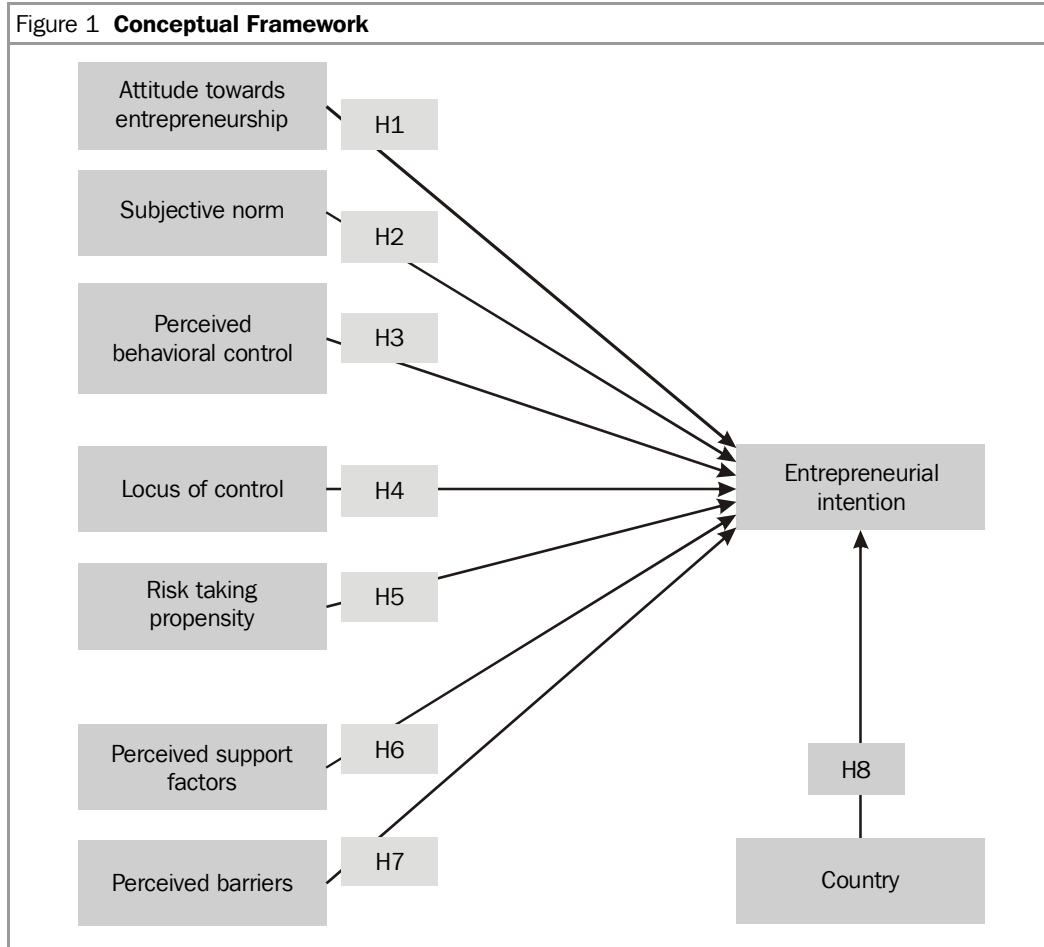

The importance of entrepreneurial intentions has been recognized in the observed Southeast European countries in the region¹ but this issue has not been tackled comparatively or using the advanced theory of planned behavior. We fill the gap by providing a theoretically plausible and empirically evidenced comparative study of entrepreneurial intent in the selected post-transition countries. According to our best knowledge, this is the first exploratory study of this kind for the set of Southeast European countries. The observed countries share the same path-dependency of ex-Yugoslav republics and belong to the same Western Balkan region, so many similarities might be found in the attitudes and behavior of neighboring citizens. However, as our study is conducted on the young population, these inherited effects might be mitigated since the dissolution of the former state.

3 Conceptual Framework and Hypotheses

The basic model of our research is based on the theory of planned behavior with additional personality variables (locus of control and risk taking propensity) and contextual variables (perceived barriers and perceived support factors). Also, we explore the effects of specific

¹ See for example Pašić Mesihović & Šestić (2016) and Macura, Konda, & Končar (2015) for Bosnia and Herzegovina, Langer et al. (2016) for Croatia, and Stanković, Dedjanski & Vojteški-Kljenak (2015) for Serbia.

national environments of four Southeast European countries on entrepreneurial intention. Our conceptual model is presented in Figure 1.

Personal attitude towards entrepreneurship, subjective norm and perceived behavioral control are basic antecedent variables of entrepreneurial intention and they represent original elements of the theory of planned behavior (Ajzen, 1991). Personal attitude towards entrepreneurship refers to the degree to which the individual holds a positive or negative personal valuation about being an entrepreneur (Ajzen, 2001; Linan and Chen, 2009). Subjective norm represents the perceived social pressure to carry out, or not carry out entrepreneurial behavior. It refers to the perception that “reference people” would approve of the decision to become an entrepreneur, or not (Ajzen, 2001; Linan and Chen, 2009). Perceived behavioral control is defined as the perception of the ease or difficulty of becoming an entrepreneur (Linan and Chen, 2009).

These three variables are theoretically considered to be key predictors of intention in any behavioral context, not just entrepreneurial (Ajzen, 1991; Krueger and Carsrud, 1993). There are numerous studies that have empirically tested this model in various settings, and

with somewhat conflicting results. Krueger, Reilly and Carsrud (2000) found empirical evidence for a positive relationship between personal attitude towards entrepreneurship and perceived behavioral control on one side and entrepreneurial intention on the other, but they could not find empirical evidence for a positive relationship between subjective norm and entrepreneurial intention. Autio et al. (2001) also could not empirically confirm the positive relationship between subjective norm and entrepreneurial intention. On the other hand, several studies have found empirical evidence for a positive relationship between all three basic antecedent variables and entrepreneurial intention (Kolvereid, 1996; Tkachev and Kolvereid, 1999; Kolvereid and Isaksen, 2006). Therefore, the following hypotheses are proposed:

H1: Entrepreneurial intention should be positively affected by personal attitude towards entrepreneurship.

H2: Entrepreneurial intention should be positively affected by subjective norm.

H3: Entrepreneurial intention should be positively affected by perceived behavioral control.

Locus of control and risk taking propensity represent two additional variables that we added to our model. They represent personality variables and might help explore how personality differences affect entrepreneurial intention. Locus of control represents the degree to which individuals believe that they have control over the outcome of events in their lives (Rotter, 1966; Lumpkin, 1985). Risk taking propensity refers to the individual's tendency to engage in activities that are perceived as risky (Brockhaus, 1980; Luthje and Franke, 2003). There are some previous studies that provide empirical evidence about the existence of a positive relationship between these two variables and entrepreneurship and entrepreneurial intention (e.g. Brockhaus, 1980; Brockhaus, 1987; Bonnett and Furnham, 1991; Hisrich and Peters, 1995; Luthje and Franke, 2003). Therefore, we propose the following hypotheses:

H4: Entrepreneurial intention should be positively affected by locus of control.

H5: Entrepreneurial intention should be positively affected by risk taking propensity.

Another set of variables added to the basic model represent contextual variables. We included two contextual variables that cover various contextual factors well and can be regarded as proxy variables for specific economic, social and cultural contexts. They are perceived support factors and perceived barriers and they were initially developed by Luthje and Franke (2003). The existing literature recognizes the importance of various social, cultural, institutional and economic contextual variables for the entrepreneurial intention formation process at the individual level. Previous studies have explored the effects of

contextual variables such as attitudes towards entrepreneurship in society, availability of business incubators, funding, content of mass-media and face-to-face communication about entrepreneurship (e.g. Shapero, 1984; Hisrich and Peters, 1995; Pennings and Kimberly, 1997; Luthje and Franke, 2003; De Pillis and Reardon, 2007). These factors have been found to have strong relationships with entrepreneurial activities. Therefore, the following hypotheses are proposed:

H6: Entrepreneurial intention should be positively affected by perceived support factors.

H7: Entrepreneurial intention should be negatively affected by perceived barriers.

An entire stream of research is focused on cross-country comparisons of entrepreneurial intentions and their antecedents. The studies range from two-country comparisons (e.g. Kristiansen and Indarti, 2004; Veciana, Aponte and Urbano; 2005) to large multi-country comparisons (e.g. Engle et al., 2010; Iakovleva, Kolvereid and Stephan, 2011). There is strong empirical evidence that entrepreneurial intention significantly differs between various countries and these differences might be explained by differences in economic, social and cultural environments. Therefore, we propose the following hypothesis:

H8: There will be differences in entrepreneurial intention among the analyzed countries.

4 Methodology

Data were collected during 2016 by using a paper-and-pencil self-administered survey. The survey was conducted in four Southeast European countries: Bosnia and Herzegovina, Croatia, Macedonia and Serbia. The sample consisted of 1,200 university students of economics and business, with 300 respondents from each country included in the study. The sample is constructed with the convenience sampling technique and it includes university students that were present at the lecture when the survey was conducted. The summary statistics of sampled respondents is presented in Table 1.

Data were collected with a highly structured questionnaire that included a set of items derived from the literature and questions about the respondent's gender, age and year of study (Appendix). The items were measured on a five-point Likert-type scale, anchored at 1 (strongly disagree) and 5 (strongly agree). The following scales were included in the questionnaire: locus of control, risk taking propensity, perceived barriers, perceived support factors, personal attitude towards entrepreneurship, perceived behavioral control, subjective norm and entrepreneurial intention. Items for locus of control were taken from Lumpkin (1985), items for risk taking propensity, perceived barriers and perceived support factors were taken from Luthje and Franke (2003), and items for personal attitude towards

entrepreneurship, perceived behavioral control, subjective norm and entrepreneurial intention were taken from Linan and Chen (2009).

Source: Authors.

Collected data were first analyzed with exploratory and confirmatory factor analysis in order to assess validity of applied measurement scales. Initial exploratory analysis with varimax raw rotation of factors was performed on the entire pool of 35 items. Nine items were removed from further analysis – these were items with low factor loadings on their primary factor and items with high factor loadings on more than one factor. The remaining items were again factor analyzed and they loaded on eight factors as hypothesized in the literature. Principal components analysis was employed to extract the factors. The Kaiser-Guttman rule was used to determine the number of factors to extract.

After exploratory factor analysis, 26 items were subjected to confirmatory factor analysis to conduct a more rigorous evaluation of the underlying factor structure and the validity of measurement scales.

Multiple regression analysis was conducted to test the hypotheses. Entrepreneurial intention was specified as a dependent variable and locus of control, risk taking propensity, perceived barriers, perceived support factors, personal attitude towards entrepreneurship, perceived behavioral control, subjective norm and country as independent variables. The tolerance measures were checked to detect possible multicollinearity. Since the values of

tolerance were between 0.74 and 0.99, it was safe to conclude that multicollinearity did not exist (Kutner, Nachtsheim and Neter, 2004). Data analysis was conducted with software package Statistica 12.

5 Results and Discussion

Initial exploratory factor analysis resulted in the removal of nine items with low factor loadings on their primary factor and high cross-loadings. Final exploratory factor analysis resulted in a factor solution with eight factors, where each item had a high factor loading on its primary factor (Table 2). The eight-factor solution explained 39.2 percent of the variance. The eight-factor solution was additionally tested with confirmatory factor analysis. Fit indices indicate an acceptable level of fit for the specified measurement model and all factor loadings were significant at the $p < 0.01$ level (Table 2). The results of exploratory and confirmatory factor analyses indicate that the applied measurement scales exhibit an acceptable level of validity.

The results of multiple regression analysis (Table 3) indicate that entrepreneurial intention is significantly and positively affected by personal attitude towards entrepreneurship ($\beta = 0.44$), perceived behavioral control ($\beta = 0.36$) and subjective norm ($\beta = 0.05$). The results also indicate that specific country environment also affects entrepreneurial intention. Respondents from Croatia, Serbia and Macedonia exhibit significantly lower levels of entrepreneurial intention when compared to Bosnia and Herzegovina as the reference country in this regression model. This result is contrary to the ease of doing business in these countries, as documented in the Doing Business Report (World Bank, 2016), where, for example, Macedonia (rank 12), as the leader in the Balkans in reforming business regulation, Croatia (rank 40) and Serbia (rank 59) are all better ranked than Bosnia and Herzegovina (rank 79), which shows a great delay in the reform process. However, the number of days to register a business, or the regulation of paying taxes or getting construction permits, does not reflect the entire business environment of a country. When reporting on a country's business regulation and environment, many additional factors of influence for investment should be taken into consideration: market size, security of the region, macroeconomic stability, cost and availability of credit, skills and training of the work force, state of the financial system, levels of corruption, etc. As an example, the best-performing country, Macedonia, has showed an increase in the promotion of entrepreneurial opportunities in recent years, but this has not contributed to an increase in the number of startups, and some of the reasons for this situation are the relatively small size of the market in respect to number of consumers, limited geographic markets and general preference for employment in the public sector or in large companies (GEM Report, 2013).

Notes: Model fit: $R^2 = 0.51$, adjusted $R^2 = 0.51$, F -value = 126.09, $p = 0.00$.

The findings on significant and positive impact of personal attitudes and perceived behavioral control on entrepreneurial intentions are in line with past research in other countries (e.g. Krueger, Reilly and Carsrud, 2000; Kolvereid and Isaksen, 2006). Perceptions are an important determinant of behavior that influences whether an individual is a potential entrepreneur. Becoming an entrepreneur is perceived to be rather easy, but this may be due to the fact that the respondents are students of business and economics, and many of them in their third and fourth year of studies with previously acquired knowledge on the topic. Nevertheless, these findings are supported by other research on the national level. For example, according to the national GEM Report for Macedonia (2013) people tend to have mainly positive perceptions of entrepreneurial activity, and 50 percent of the respondents (population of 18-64 years of age) believe that they have the necessary knowledge and skills to start and manage a business. Furthermore, 37 percent (population of 18-64 years of age) think that there are good opportunities to start a business in the next six months in the area where they live, and 29 percent consider themselves a latent entrepreneur who intends to start a business within three years. This percentage of entrepreneurial intent among the population (18-64 years of age) in Macedonia is higher than in the other Balkan countries, opposing our research which suggests that in regards to young people (18-29 years of age), Bosnia and Herzegovina has taken the leadership in the region. Still, when we analyze further, we can see that more than half of the entrepreneurs from Macedonia (60,98 percent) are entrepreneurs from necessity, a number that is higher than in any other Balkan country (GEM Report, 2013). This situation is determined by low economic development and high unemployment rate. Additionally, Bosnia and Herzegovina is the only Balkan country where the number of entrepreneurs from necessity is lower than entrepreneurs motivated by opportunity. In the

European context, for instance, the number of those who started their businesses due to opportunity is almost half the total number of respondents who at some point run a business, while those who became entrepreneurs from necessity form less than a third of all the respondents (European Commission, 2013). Although methodology and scope of the indicators are different, it is worth putting our results on entrepreneurial intentions in the GEM context – which for Croatia shows that 20 percent of the adult population is considered latent entrepreneurs, i.e., have expressed their intent to become an entrepreneur in the next three years².

In the observed Southeast European social setting, the variable social norm plays an important role in forming individual entrepreneurial intention. Contrary to the findings of Autio et al. (2001) close friends and family support matters in future business undertaking. This may be a consequence of the fact that most of the interviewed young people still live with their families and are financially dependent on their parents. Eurostat data for 2013 provide evidence that in the EU-28 only 39 percent of young population aged 25-29 live with their parents, while in the observed countries this percentage is much higher: 71 percent in Macedonia³, 70 percent in Croatia and 66 percent in Serbia. Further it seems that countries where high share of the population aged 20-29 still lives with their parents have higher youth unemployment rate. Some of these young people are in the education process, but others might be even unwilling to look for a job (Tomić, 2016).

On the other side, perceived support factors referring to the institutional support and positive general image of entrepreneurs in the society is not important for entrepreneurial intention. Aligned with this finding, legislation and bank support do not stand as significant obstacles to entrepreneurial intention. This result is interesting because business climate in the Western Balkans is poor⁴, however, perceived barriers seem not to hamper entrepreneurial intention in the surveyed countries and this is in line with previous findings for Croatia that anti-entrepreneurial climate does not seem to be influencing students' entrepreneurial aspirations (Langer et al., 2016). Young entrepreneurs-to-be might have the courage, although risk taking propensity is not a significant determinant of their entrepreneurial intention in the region.

The rate of unemployment among young population is considerably higher than among the adults in all surveyed countries (Tomić, 2016). Those young, educated people who have strong commitment to the idea of starting their own business consider this their own responsibility, especially if they think they would have the support of their families or close friends. This can be further elaborated and explained through the institutional support to

³ Data for Macedonia are for 2012.

⁴ See SEE-6 Economic Outlook, 2015, Švaljek (Ed), 2015.

the development of entrepreneurship in the observed Southeast European countries. For instance, the support to young entrepreneurs in Serbia is rather sporadic in spite of big plans to put the development of small and medium sized enterprises and entrepreneurship at the top of the agenda of economic policy reforms for this decade (Government of Serbia, 2015). These plans are a continuation of the previous economic reforms that did not result in a significant growth of the entrepreneurial sector. Maybe this is why young people do not yet perceive the institutional support as strong and continuous. In Serbia, young people rather opt for employment in organizations, in the informal sector or to stay unemployed instead of choosing self-employment as an option.⁵ In the after-crisis period in Croatia, necessity self-employment is dominant for both young and especially so for the old unemployed people, whereas opportunity self-employment is slightly more pronounced in the case of the young population (Botrić & Tomić, 2016).

6 Conclusion

This research on entrepreneurial intentions in a set of post-transition countries provides pioneering insight into the attitudes and behavior of young entrepreneurs-to-be in the Balkans region. Personal attitude towards entrepreneurship is mostly positive and it has a significant influence on the entrepreneurial intent.

Contrasted to other studies for other countries, in the observed countries social norm is an important determinant of entrepreneurial intentions. It seems that in the case of Southeast European countries, the opinion of a third party (friends or family), i.e., social norm is of great importance for the decision to start a business. This could mean that in order to boost entrepreneurial intention, the promotion of entrepreneurship should be aimed at a more general public.

One of the most intriguing findings is that entrepreneurial intentions in Bosnia and Herzegovina are higher than in other countries in the region. This finding goes hand in hand with Bosnia and Herzegovina standing as the only Balkan country where the number of entrepreneurs from opportunity rather than from necessity prevails, yet requires more in-depth study of the reasons standing behind national specifics. In our discussion, the lack of comparable statistical data restricted the analysis of Bosnia and Herzegovina in the international context.

The results on the positive and significant impact of perceived behavioral control on entrepreneurial intention are in line with past research (Krueger, Reilly and Carsrud, 2000). Young people have in general more self-confidence, which seems to be decisive for

⁵ Among those seeking for a first job only about 11 percent opt for self-employment (Government of Serbia, 2015).

entrepreneurial intention, in particular since our sample comprises students of business and economics that have gathered certain knowledge on developing entrepreneurial projects and management. Given the scope of our research, focus on the business students limits the extension of conclusions to the general population.

Future research can include young people with different educational background in order to expand the characteristics of the sample, use other measures in addition to the self-administered survey and include a longitudinal study for better understanding of the causality between the tested factors of influence and entrepreneurial intention. In addition to this, it would be interesting to ask young entrepreneurs who have already established their businesses what were the main factors influencing them while developing their entrepreneurial projects. We also recommend a further exploration of the role of economic and environmental variables in these countries, which may affect the relationship between the above-mentioned factors and entrepreneurial intention. This research shows that in the selected Southeast European countries there is a clear entrepreneurial intent and that the idea of entrepreneurship and entrepreneurial mindset is familiar to young population. However, there are a number of obstacles to this intent being effectively launched and realized. This probably stands as a reason for young entrepreneurs-to-be in the post-transition economies in the Western Balkans region to consider locus of control, risk, barriers and supporting factors less important for their entrepreneurial projects becoming true. Finally, more studies on the entrepreneurial intent and youth unemployment problem in the post-transition setting should be undertaken. Higher levels of entrepreneurial intent might induce self-employment of youth and job creation for young people and thus contribute in alleviating this burden to the national economies in the region.
