Labour Force Survey Data, March and 1st Quarter of 2017

Seasonally Adjusted Data ([For monthly data 3/2017](#), [for quarterly data 1/2017](#))

It should be noted that the seasonally adjusted series are partially based on past data from the quarterly labour force survey, so these series may change in the future after they are fully replaced by series based on the monthly labour force survey.

In March 2017:

- Unemployment rate among persons aged 15 and over from the labour force – 4.2% (same as in February 2017).
- Participation rate in the labour force among persons aged 15 and over – 63.8% (compared with 64.0% in February 2017).
- Employment rate (the percentage of employed persons out of the total population) among persons aged 15 and over – 61.1% (compared with 61.3% in February 2017).

In the 1st quarter of 2017 (January-March):

- Unemployment rate among persons aged 15 and over from the labour force – 4.2% (compared with 4.4% in the 4th quarter of 2016).
- Participation rate in the labour force among persons aged 15 and over – 64.0% (compared with 64.1% in the 4th quarter of 2016).
- Employment rate among persons aged 15 and over – 61.3% (compared with 61.2% in the 4th quarter of 2016).
- Unemployment rate among persons aged 25-64 from the labour force – 3.7% (compared with 3.8% in the 4th quarter of 2016).
- Participation rate in the labour force among persons aged 25-64 – 80.0% (same as in the 4th quarter of 2016).
- Employment rate among persons aged 25-64 – 77.0% (same as in the 4th quarter of 2016).
- The share of employed persons usually working full time out of total employed persons – 78.4% (compared with 78.3% in the 4th quarter of 2016).

Written by Mark Feldman, Director of Labour Sector

For explanations and clarifications, please contact the Press Relations Unit, at 02-6527845

The Labour Force Survey is the main source of information regarding the labour force in Israel, and is conducted by the Central Bureau of Statistics on an ongoing basis.

In 2017, an average of 20,700 persons aged 15 and over a month have been interviewed on an ongoing basis. The survey population includes the permanent population of Israel, as well as tourists and temporary residents living in Israel continuously for one year or more. The survey follows the development of the labour force in Israel, its size and characteristics, the extent of unemployment, etc.

March 2017 (Seasonally Adjusted Data)

In March 2017, **the number of persons in the labour force** among persons **aged 15 and over** was 3.960 million. Of these, 3.793 million were **employed** and 167,000 were **unemployed**. Among employed persons, 2.006 million were **males** (compared with 2.001 in February 2017) and 1.787 million were **females** (compared with 1.796 million in February 2017).

The participation rate among persons aged 15 and over in the labour force in March 2017 declined to 63.8% (compared with 64.0% in February 2017). Among **males** (see Diagram 3), that rate reached 68.9% (same as in the February 2017), and among **females** it declined to 59.0% (compared with 59.3% in February 2017).

The unemployment rate among persons aged 15 and over from the labour force (see Diagram 1), reached 4.2% in March 2017 (same as in February 2017). The unemployment rate of **males** (see Diagram 2) reached 4.2% (same as in the previous month), whereas among **females** it reached 4.3% (same as in the previous month).

The employment rate (calculated as the percentage of employed persons out of the entire population) **among persons aged 15 and over** declined to 61.1% in March 2017 (compared with 61.3% in February 2017). The employment rate among **males** (see Diagram 4) rose to 66.1% (compared with 66.0% in the previous month), and that of females declined to 56.4% (compared with 56.8% in the previous month).

 (SEASONALLY ADJUSTED DATA)

1st Quarter Average (January-March) 2017 (Seasonally Adjusted Data)

In the 1st quarter of 2017, **the number of persons in the labour force** among persons **aged 15 and over** was 3.963 million. Of these, 3.795 million were **employed** and 168,000 were **unemployed**. Among the employed persons, 2.002 million were **males** (compared with 1.988 million in the 4th quarter of 2016) and 1.793 million were **females** (compared with 1.788 million in the 4th quarter of 2016).

The participation rate among persons aged 15 and over in the labour force in the 1st quarter of 2017 declined to 64.0% (compared with 64.1% in the previous quarter). Among **males**, that rate rose to 68.9% (compared with 68.8% in the previous quarter), whereas among **females** that rate declined to 59.3% (compared with 59.5% in the previous quarter).

The unemployment rate among persons aged 15 and over from the labour force, declined to 4.2% in the 1st quarter of 2017 (compared with 4.4% in the 4th quarter of 2016). The unemployment rate of **males** declined to 4.2% (compared with 4.3% in the previous quarter), whereas that of **females** declined to 4.3% (compared with 4.5% in the previous quarter).

Among persons aged 25-64 the participation rate in the labour force reached 80.0% in the 1st quarter of 2017 (same as in the 4th quarter of 2016). Among **males aged 25-64** the rate rose to 85.1% (compared with 84.7% in the previous quarter), whereas among **females aged 25-64** the rate declined to 75.1% (compared with 75.5% in the previous quarter).

Among persons aged 25-64 the unemployment rate from the labour force declined to 3.7% in the 1st quarter of 2017 (compared with 3.8% in the 4th quarter of 2016). Among **males aged 25-64** the unemployment rate reached 3.8% (same as in the previous quarter) whereas among **females aged 25-64** the unemployment rate declined to 3.7% (compared with 3.9% in the previous quarter).

The number of employed persons in the 1st quarter of 2017 reached 3.795 million (compared with 3.777 million in the 4th quarter of 2016). The number of **employed persons who usually worked full time (35 hours and over per week)** rose by 0.7% compared with the 4th quarter of 2016 (an increase of approximately 20,000 employed persons), whereas the number of **employed persons who usually worked part time (less than 35 hours per week)** declined by 0.1% compared with the 4th quarter of 2016 (a decrease of 400 employed persons). The share of those **usually employed full time** of all employed persons rose to 78.4% (compared with 78.3% in the previous quarter). Among **males** that share rose to 87.2% (compared with 87.0% in the previous quarter), whereas among **females** it reached 68.6% (same as in the previous quarter). (Detailed figures can be found in Tables 1.24-1.26 in the "[Labour Force Survey Quarterly – Labour Force and Wages Statistics](#)" on the website).

The number of **persons who worked full time (35 hours and over) in the determinant week** rose by 1.0%, compared with the 4th quarter of 2016 (an increase of 26,000 employed persons), whereas the number of **persons who worked part time (less than 35 hours) in the determinant week** declined by 0.5%, compared with the 4th quarter of 2016 (a decrease of approximately 5,000 employed persons).

The number of **persons temporarily absent from work** in the determinant week declined in the 1st quarter of 2017 by 13.2%, compared with the 4th quarter of 2016 (a decrease of approximately 36,000 employed persons). (Detailed figures can be found in Tables 1.4-1.6 in the "[Labour Force Survey Quarterly – Labour Force and Wages Statistics](#)" on the website).

The employment rate (calculated as the percentage of employed persons out of the entire population) **among persons aged 15 and over** rose to 61.3% in the 1st quarter of 2017 (compared with 61.2% in the 4th quarter of 2016). The employment rate among **males aged 15 and over** rose to 66.0% (compared with 65.9% in the previous quarter), whereas the employment rate among **females aged 15 and over** decreased to 56.7% (compared with 56.8% in the previous quarter). Among **persons aged 25-64** the employment rate reached 77.0% (same as in the previous quarter). Among **males aged 25-64** the employment rate rose to 81.9% (compared with 81.5% in the previous quarter), and among **females aged 25-64** the employment rate declined to 72.3% (compared with 72.6% in the previous quarter). (Detailed figures can be found in Table 1.23 in the "[Labour Force Survey Quarterly – Labour Force and Wages Statistics](#)" on the website).

The average weekly number of work hours per employed person rose to 36.6 in the 1st quarter of 2017 (compared with 36.3 hours in the previous quarter). **The average weekly number of work hours per employee** rose to 36.7 in the 1st quarter of 2017 (compared with 36.4 hours in the previous quarter).

The number of **employees working part time involuntarily** (i.e., those who searched for full-time or additional work but did not find it) reached approximately 86,000 in the 1st quarter of 2017 (a decline of 2.7% compared with the previous quarter), and their share out of all employed persons declined to 2.3% (compared with 2.4% in the previous quarter). The share of **males working part time involuntarily**, out of all employed males, rose to 1.3% (compared with 1.2% in the previous quarter), and the share of **females working part time involuntarily**, out of all employed females, declined to 3.4% (compared with 3.6% in the previous quarter). (Detailed figures can be found in Table 2.9 in the "[Labour Force Survey Quarterly – Labour Force and Wages Statistics](#)" on the website).

Labour Force Characteristics by District of Residence

(Detailed figures can be found in Tables 1.11-1.16 in the "[Labour Force Survey Quarterly – Labour Force and Wages Statistics](#)" on the website).

The unemployment rate among persons aged 15 and over declined in the 1st quarter of 2017 in most of the districts compared with the 4th quarter of 2016 and reached: 5.4% in the **Jerusalem District** (compared with 5.8%), 5.4% in the **Northern District** (compared with 5.3%), 4.8% in the **Haifa District** (compared with 4.5%), 3.5% in the **Central District** (compared with 3.7%), 3.2% in the **Tel Aviv District** (compared with 3.3%), 4.8% in the **Southern District** (compared with 5.3%).

The participation rate among persons aged 15 and over in the labour force rose in half of the districts in the 1st quarter of 2017 compared with the 4th quarter of 2016. The participation rate reached 54.7% in the **Jerusalem District** (compared with 55.6%), 57.4% in the **Northern District** (compared with 58.4%), 62.6% in the **Haifa District** (compared with 61.3%), 70.3% in the **Central District** (compared with 70.4%), 69.7% in the **Tel Aviv District** (compared with 69.6%), and 62.9% in the **Southern District** (compared with 59.8%).

The employment rate among persons aged 15 and over rose in most of the districts in the 1st quarter of 2017 compared with the 4th quarter of 2016. The employment rate reached 51.8% in the **Jerusalem District** (compared with 52.4%), 54.2% in the **Northern District** (compared with 55.3%), 59.5% in the **Haifa District** (compared with 58.5%), 67.8% in the **Central District** (compared with 67.7%), 67.4% in the **Tel Aviv District** (compared with 67.3%), and 59.9% in the **Southern District** (compared with 56.6%).

Employed Persons by Industry ([By the new classification of All Economic Activities \(Updated edition\), Technical Publication no. 80](#))

(Detailed figures can be found in Tables 2.1 and 2.5 in the ["Labour Force Survey Quarterly – Labour Force and Wages Statistics" on the website](#)).

In the 1st quarter of 2017 the number of **employed persons** increased by approximately 18,000 compared with the 4th quarter of 2016. The number of **employees** in the 1st quarter of 2017 reached 3.325 million (compared with 3.304 million in the 4th quarter of 2016). Table 1 below presents the number of employed persons and employees by industry in the 1st quarter of 2017 and 4th quarter of 2016.

Among **employed persons**, the greatest **increases** were in **Human health and social work activities** (approximately 14,000 employed persons), **Arts, entertainment and recreation** (approximately 7,000 employed persons), **Administrative and support service activities** and **Construction** (approximately 4,000 employed persons in each industry), **Wholesale and retail trade and repair of motor vehicles** and **Transportation, storage, postal and courier activities** (approximately 3,000 employed persons in each industry).

The greatest **decreases** were in **Manufacturing; Mining and quarrying** (approximately 7,000 employed persons), **Information and communications** (approximately 5,000 employed persons) and **Electricity supply** (approximately 4,000 employed persons).

Among **employees**, the greatest **increases** were in **Construction** (approximately 11,000 employed persons), **Wholesale and retail trade and repair of motor vehicles** (approximately 7,000 employed persons), **Human health and social work activities** (approximately 6,000 employed persons), **Accommodation and food service activities** and **Households as employers** (approximately 4,000

employed persons in each industry) and **Arts, entertainment and recreation** (approximately 3,000 employed persons)

The greatest **decreases** were in **Information and communications** and **Education** (approximately 6,000 employees in each industry), **Electricity supply** (approximately 4,000 employees) and **Manufacturing; Mining and quarrying** (approximately 3,000 employees).

TABLE 1.- EMPLOYED PERSONS AND EMPLOYEES, BY INDUSTRY (2011 CLASSIFICATION) 4th QUARTER OF 2016 AND 1st QUARTER OF 2017, SEASONALLY ADJUSTED DATA, THOUSANDS

Section	Description	Employed persons		Employees	
		Quarter 4/2016	Quarter 1/2017	Quarter 4/2016	Quarter 1/2017

(1) Incl. employed persons or employees in the industry "Activities of extraterritorial organizations and bodies" (Category U), and persons whose industry is not known.

Employed Persons by Occupation ([By the new classification of Occupations, Technical Publication no. 81](#))

(Detailed figures can be found in Tables 2.10 and 2.14 in the "[Labour Force Survey Quarterly – Labour Force and Wages Statistics](#)" on the website).

Table 2 below presents the number of **employed persons** and **employees** by occupation in the 1st quarter of 2017 and in the 4th quarter of 2016.

Among **employed persons**, the greatest **increases** were among **Skilled workers in manufacturing and construction, and other skilled workers** (approximately 17,000 employed persons) and **Service and sales workers** (approximately 12,000 employed persons).

The greatest **decreases** were in **Professionals** (approximately 7,000 employed persons), **Elementary occupations** (approximately 6,000 employed persons), **Clerical support workers** and **Managers** (approximately 4,000 employed persons in each occupation).

Among **employees**, the greatest **increases** were in **Skilled workers in manufacturing and construction, and other skilled workers** (approximately 20,000 employees) and **Service and sales workers** (approximately 15,000 employees).

The greatest **decreases** were in **Professionals** (approximately 22,000 employees), **Elementary occupations** (approximately 5,000 employees) and **Clerical support workers** (4,000 employees).

TABLE 2.- EMPLOYED PERSONS AND EMPLOYEES, BY OCCUPATIONS (2011 CLASSIFICATION), 4th QUARTER OF 2016 AND 1st QUARTER OF 2017, SEASONALLY ADJUSTED DATA, THOUSANDS

Major group	Description	Employed persons		Employees	
		Quarter 4/2016	Quarter 1/2017	Quarter 4/2016	Quarter 1/2017

[Definitions and Explanations](#)

METHODS:

As of 2012 the format of the Labour Force Survey changed from a quarterly survey to a monthly survey.

Panels and their Mode of Investigation

The sample drawn each year is divided into four mutually exclusive groups, known as panels. The panels are introduced into the survey investigation in four consecutive quarters, one panel in each period. Each panel is investigated for a number of periods, sometimes with a break between the investigations. Since the new survey is monthly, the annual sample is divided into twelve panels. The difference between the different rotation methods of panels is in the percentage of overlap between consecutive months, between parallel months of consecutive quarters, or between parallel months of consecutive years.

Therefore, the investigative format of panels has an impact on sampling errors of the various estimates. Generally, it can be said that the larger the overlap of the panels between two periods of time, the smaller the sampling error of the estimates of change between periods (for example, change in the number of unemployed persons between month t and month $t-1$), in comparison with exclusive samples of the same size. Regarding estimates on the quarterly or annual level – the larger the overlap between the months, the greater the sampling error of the quarterly or annual estimate, in comparison to that estimate if it were based on exclusive samples of the same size.

The monthly rotational structure of panels, known as 4-8-4, is appropriate for determining priorities for estimates of change of different periods. The Labour Force Survey in the USA uses this structure as well. In the rotational structure, eight investigations are performed for each panel, in the following way: Investigation in the introduction month and the three following months (investigations 1-4), a break of eight months and four more consecutive investigations in the following months (investigations 5-8), in months parallel to the first months of investigation.

As can be seen in Table C, each month is composed of eight panels, two of which were not investigated in the previous month (one of them is returning from a rest of eight months and one is new), and the rest were investigated. Each quarter includes twelve exclusive panels, of those, four were investigated only once, four were investigated twice, and the rest were investigated three times. Each year includes twenty-seven exclusive panels in total, of those, eighteen are investigated four times consecutively, and the rest are investigated less. The introductory month to the survey and the exit month from the survey are separated by sixteen months for each panel, and therefore, no panel will be investigated eight times during one year. For each two consecutive months, there are six common panels and two exclusive ones, one of them old and the second one new. For each two parallel months, separated by a quarter, there are two common panels and six exclusive ones. For each two parallel months of consecutive years there are four common panels and four exclusive panels.

Table C. Example of Investigation of Panels in the 4-8-4 Structure

Sampling

Most of the survey population is covered by current samples generally drawn once a year. A small part of the population whose characteristics do not change over time is covered by permanent samples taken from the 2008 Census.

Current Samples

Sampling Fraction

The survey is planned so that in each panel a sample of approximately 1,500 dwellings should be obtained. At the stage of planning the yearly sample, the sampling fraction, expressing the relationship between the planned sample size and the population size of that year, is determined. The sampling fraction is the same for all population groups, but can change between sampling years. The size of the obtained sample is a little more than 0.7% of the household population.

The Main Sampling Method

Most of the final sampling units are dwellings, which are sampled in a two-stage method. In the first stage, localities are sampled, with probability proportional to size. In the second stage, dwellings are sampled in the sampled localities, so that the final sampling probability of the dwelling is equivalent to the sampling fraction of that year. The sampled dwellings are placed in sampling “portions” of approximately eight to nine dwellings and each portion is allocated to a panel, and assigned a fixed determinant week.

First stage - sampling of localities

The sample of localities in the survey is taken from a list of localities (the locality sampling frame), and the localities are placed in three main groups, according to their size:

- a. Very large localities are included in the entire sample year (with certainty) in all twelve panels. This group includes less than 40 localities, however, approximately 70% of the survey population are concentrated in them.
- b. Medium sized and large urban localities are included in the entire sample year (with certainty) in one panel, two, three, four, six or nine panels, but not in all the panels. The larger the locality is, the larger the number of panels that are in it. Annually, close to 100 localities of this type are sampled, and their population comprises approximately 20% of the survey population.
- c. Small localities, urban and rural, are called probability localities in the sample format. These localities are divided into homogeneous groups, called sampling strata, similar to the geographical groupings used for determining the weights of the survey (see detailed geographic groupings in Table E, "Estimation Method", below) and according to other characteristics. The localities are arranged in each stratum according to various characteristics and a systematic random sample is drawn, the probability of each locality to be sampled being proportional to its size. Thus, these localities are known as “probability localities”. The sample in each locality is usually placed in one panel. Each year a sample of localities is taken, dependent on the previous year’s sample, to ensure that as many different localities as possible are included in the samples of two adjacent years, which are sometimes investigated in the same months more than once. Altogether, each year approximately 200 “probability” localities are sampled out of approximately 1,100 localities in the frame.

Stage two – sampling within the sampled localities

In every locality that is sampled, a sample of residential dwellings is taken, although sometimes (mostly in non-urban localities) households or other units are sampled. The sampling is done as follows:

- a. Sampling from municipal tax files – each year, a sample of dwellings is taken from the frame obtained from the Dwelling and Buildings Register of the CBS, for approximately 180 of the larger localities. This Register is constructed from the municipal tax files of localities. In every file, on each record (property) there are means of identification (number in the locality, address and name of resident), type of property (such as the use for which the property is designated – residential or other). Records of non-residential property are deleted from the file, so that the sampling frame includes only residential dwellings. The records in the file undergo a procedure of coding the addresses and anchoring them, so that by the end of the procedure the statistical area (the locality's internal geographic division) of each record is known as well. This division is usually for localities with approximately 15,000 residents or more. The dwellings are then arranged geographically, in which the statistical area is usually the main geographical characteristic. After sorting the records, a systematic random sample is taken. In other words, a random beginning is chosen, which determines the first dwelling sampled, and the rest of the dwellings in the sample are determined by fixed jumps. By this method, a random sample of dwellings spread over all the locality and all the statistical area of the locality is obtained.
- b. Sampling from lists of households – Most of the villages, moshavim, and some of the urban localities, are not yet in the Dwelling and Building Register and therefore a sample is taken from lists of households or dwellings. A systematic random sample is taken near to the time of investigation from a list of households or dwellings obtained from the secretariats of the localities.
- c. Sampling from lists of persons – it is usually difficult to obtain a list of households in kibbutzim. Therefore for those kibbutzim sampled in the survey, a list of persons aged 18 and over residing permanently in the kibbutz is obtained close to the time of the first interview. A systematic random sample of persons is chosen from this list. A sampled person who is a head of household (in accordance with definitions laid down in advance) is interviewed together with the other members of the family. A person who is sampled but is not a head of household is not included in the sample (unless one of the other sampled persons is the head of their household).

Special Samples

A small part of the current sample is not drawn by the main sampling method described above, but instead by other methods, depending on the sampling frame and various other constraints.

- a. Samples in student hostels and immigrant absorption centers – Neither persons nor households in student hostels and immigration absorption centers are covered by the Dwelling and Building Register. In order to include these populations in the current Labour Force Surveys, special sampling frames of dwelling units in student hostels (in the seven large universities) and immigrant absorption centers are compiled. A one-stage sample of dwelling units is taken from these frames once a year and is allocated evenly to the panels of the sample year.
- b. New buildings – The investigation of the main sample of the Labour Force Surveys in urban localities may extend up to two and a half years from the time the sample was taken. Since the original sample of

dwelling does not represent the population that moved into dwellings of which the construction was completed after the sampling, these dwellings have to be represented by a supplementary sample. Thus, each quarter, an additional sample is taken from special sampling frames of new dwellings in the urban localities for each panel whose investigation has not yet finished. In rural localities, no supplementary sample is taken since the first interview is held close to the time of taking the sample and the fourth interview is completed after about a year and a quarter after the sample was taken.

Changeover or Multiple Households in the Sample Unit

It should be mentioned that because the sample unit is a dwelling, the household residing there at the time of the interview is investigated. Thus, in the case of a changeover of residents, the new household is interviewed. The same principle applies when the sampling is from a list of households – the interviewer returns to the same address. In the case of more than one household in the sampled dwelling, all the households, including all persons aged 15 and over, are interviewed.

Allocation of the current sample over time

Because one of the main goals of the Labour Force Survey is to measure changes in the characteristics of the labour force over time, a number of steps are taken to minimize the variation in the sample over time. Each year, localities are allocated to panels so that an optimal balance is achieved with regard to the sample size and characteristics of the localities in each panel. In very large localities, which are surveyed in every panel, each panel contains a uniform number of interview quotas (portions). Each panel is distributed over about one-fourth of the locality, in order to reduce the distances that interviewers have to cover between the dwellings in their interview portions. However, the eight panels surveyed each month are distributed evenly in all parts of the locality.

The interviewers' portions in the current sample are allocated among 12 panels, so that balanced samples were obtained with respect to the following:

- The number of portions in each panel.
- The number of portions according to locality groups (for example, kibbutzim, moshavim, Arab localities).
- The number of portions in localities where there are 12 portions a year or more.

Furthermore, the week of interviewing is designated within the month for each portion, so that a balanced sample will be obtained over the four weeks of the month.

Size of the current monthly sample

In each month, there are about eight panels with about 1,500 dwellings each, so a total of about 12,000 dwellings are included each month. In these dwellings, between 9,000 and 9,500 households are expected to be interviewed.

Permanent Samples from the 2008 Population Census

Because of the difficulty of interviewing certain sections of the survey population on a regular basis, "permanent" samples were taken from a sampling frame comprising records from the socio-economic sample used in the 2008 Population Census. These samples participate in the survey estimates, by means of data collected in the Census, and do not change between censuses.

The permanent samples are:

Institutions not investigated currently in the survey

Other institutions besides the types of institutions mentioned in the section "special samples", such as dormitories at educational institutions and homes for the elderly, are not covered in the current samples of the survey. These institutions are included in the current estimates through socio-economic data collected in the 2008 Population Census. The census data are sample data. A total of about 23,500 persons aged 15 and over were included in the permanent sample of institutions in the Census, which represent about 175,000 persons aged 15 and over in the population.

Persons living outside of localities in the south district

Households belonging to Bedouin tribes in the South are also covered in the socio-economic data of the 2008 Population Census. These data are also sample data, and include about 2,900 persons aged 15 and over who represent a population of about 11,000 households with about 22,500 persons aged 15 and over.

The Interview and Questionnaire

Interviews were conducted by approximately 90 interviewers from the Central Bureau of Statistics (about 45 field interviewers, and about 45 telephone interviewers), who receive ongoing training and supervision. Each field interviewer receives a weekly quota of 8-9 dwellings to cover. Telephone interviewers use a general list of dwellings, which are divided according to the week of the interview without allocating interview quotas to each interviewer. In 1st quarter 2017, interviews were conducted in 77.0% of the households that were intended to be investigated in the survey (compared with 75.1% in the 4th quarter of 2016). The calculated percentage of interviewed households excluded cases that were not intended to be investigated, such as unoccupied dwellings, non-residential dwellings, and households that were not in the survey population. These cases are considered "zero" cases, 7.0% of the gross sample in 1st quarter 2017 (same as in previous quarter) (see Table D).

In residential dwellings, the interviews were conducted with one of the adult household members, who provided information about all of the members of the household (in dwellings with more than one household, each household was investigated). For households where nobody was home on the first visit, interviewers usually make two subsequent visits. For each visit in which no household member is interviewed, the interviewer indicates the reason in a "non-investigation" questionnaire.

In addition to "zero" cases, non-investigation can be due to absence of household members, refusal to respond, or other reasons such as difficulty with communication or inability to locate the dwelling. Households that are not investigated for these reasons are considered "non-response" cases (23.0% of the net sample in 1st quarter 2017, compared with 24.9% in the previous quarter).

The final reason for non-investigation (including reasons for "zero" cases) is determined according to data provided by the interviewers in the data collection process and is determined after data processing and editing. With regard to "zero" cases, the interviewers also rely on information obtained from neighbors of the household members. With regard to cases of non-investigation because of "non-response", the information is mainly obtained from the household members themselves.

Data are collected in face-to-face interviews, using the Computer Assisted Personal Interviewing (CAPI) method in Stage A. In the other stages, data were collected in telephone interviews using the Computer Assisted Telephone Interviewing (CATI) method. In 1st quarter 2017, out of all the dwellings surveyed, 88.5% of the interviews were conducted by telephone (compared with 87.5% in the previous quarter). For each dwelling, one questionnaire was completed with information pertaining to all the households and to each member aged 15 and over.

The questionnaire for individuals includes questions on: work in the determinant week, number of work hours usually worked and hours actually worked in the determinant week, number of work hours less than usual in the determinant week, number of overtime hours, reasons for part-time work, reasons for absence from work (during the entire determinant week or part of it), place of work, geographical mobility of all employed persons, industry and occupation, and status at work. In addition, information is obtained on activities of unemployed persons such as seeking work, mode and length of time of search, search for full-time or part-time work, reasons for unemployment, whether the individual ever worked in Israel and when, and the activities of unemployed persons prior to seeking work. For employed persons, the amount of time worked during the year and reasons for working only part of the year are also investigated.

Those persons not in the labour force but who had worked during the year preceding the interview, are asked about their last work. Those not in the labour force and who did not work during the year preceding their interview, are asked why they did not work.

Apart from details about work, demographic information is also collected: age, sex, marital status, country of birth, length of time in Israel, level of education (number of years of schooling, type of school last attended, and highest diploma received. Information on whether one studied in a Yeshiva, what type of Yeshiva, and number of years of study in a post-secondary Yeshiva is collected for Jewish men).

The household questionnaire includes information on the number of persons in the household, the number of rooms in the dwelling, the number of children in the household, number of hours of work of paid domestic help, ownership of the dwelling and who the dwelling is rented from, religious way of life of the people living in the dwelling, and people with disabilities living in the dwelling and types of disabilities.

Table D.- Sample Size (Dwellings/Households) – Excluding Permanent Samples

Month and year		Gross sample (dwellings)			Intended sample of households to be interviewed			
		Total	Zero cases	Belong to population	Total	Interviewed	Not interviewed (non-response)

The Estimation Method

General

In the monthly Labour Force Survey, it was decided to introduce an innovative estimation method. This method was proposed by Fuller and Rao (2001), and is known as Regression Composite Estimation. The estimator obtained through this method is referred to as a "composite estimator". The advantage of the new method over the method used in quarterly Labour Force surveys lies in the utilization of information from the previous month in the estimates of the current month. The estimator obtained through this method is usually more efficient. That is, the sampling error of composite estimators for a sample of the same size is usually lower than that of the estimators used in quarterly surveys for certain parameters that defined as meaningful.

Calibration of the Survey Estimates

In composite estimates, data on the individuals and households surveyed in a given month are calibrated in terms of the total known population by cross-sections of a geographic area, sex, and age group (in the same way that calibration was done in the quarterly Labour Force Survey, see Table E). In addition, the data are calibrated on the basis of estimates of labour force data estimates from the previous month. That is, whereas the estimator used until now was calculated only on the basis of current information (at time "t") and did not utilize existing information from the past about the individuals interviewed in the survey, the composite estimator also uses relevant information from the past. For example, if an individual was employed in the previous month, there is a very good chance that the individual will continue to be employed in the current month. This estimation method has been used in labour force surveys in Canada and Australia.

Besides the attempt to reduce the sampling error obtained in the monthly estimators, an attempt is also made to reduce the sampling errors of estimated changes between different periods for labour force parameters. In fact the new sampling method also allows for flexibility in the effectiveness that one seeks to attribute to estimates of change between two periods (e.g., month "t" versus month "t-1"), in comparison with the efficiency attributed to monthly estimators. In general, improvement in one estimator is usually at the expense of improvement in another estimator. To alleviate this problem, a new parameter has been defined, which controls the importance attributed to information based on changes from one month to another. The higher the parameter, the more emphasis is placed on improving the change estimates.

A review of the new method in the professional literature and in simulations conducted at the Central Bureau of Statistics indicates that composite estimators of levels and change are substantially more effective. Regarding the variables that were included in the calibration process, the improvement in the effectiveness of level estimates for unemployed persons ranged from 5% to 10%, and the improvement in the effectiveness of level estimates for employed persons was 20% and more. In addition, an improvement was found in the effectiveness of monthly change estimates. However, with regard to the variables that were not included in the calibration process, when there was a correlation between those variables and the variables included in the calibration there was usually improvement; and when there was no correlation

between the variables, the improvement was expected to be negligible or no improvement was expected at all.

Table E.-The New Weighting Groups in the Labour Force Survey (Age * Sex * Locality Groups)

Weighting coefficients are separately calculated for men and women

Geographic distribution				Age groups								
Group no.	Geographic region		Locality groups	0-14 (1)	15-17	18-21	22-24	25-34	35-44	45-59	60-66	67+

(1) The 0-14 age group includes both sexes

(2) Including urban Arab localities in the Jerusalem District.

CHAPTER C: RELIABILITY OF THE ESTIMATES

The data presented in this publication are estimates for the population as a whole although they are based on a sample survey. As such, they are prone to errors, which may be of two types: sampling errors and non-sampling ones.

1. Sampling Errors

Sampling errors occur because only a sample of the population is investigated. The particular sample used in this survey is one of a large number of possible samples of the same size that could have been selected using the same sampling method. It is clear that estimates based on different samples will differ from one another, and almost all of them will differ from the value obtained had a complete census been taken – “the census value.”

The **estimate** X' is the value estimated from the specific sample of this survey, of the corresponding value X that would have been obtained had a complete census been conducted.

The **sampling error** $\sigma(X')$ is an average measure of the variability between the different values of the estimate that would have been obtained from all possible samples of the same size and derived by the same sampling method and the census value obtained under the same conditions of data collection.

In view of the variability of sample estimates, it may preferable to consider a range of values where the census value is likely to be found, with a given probability (or level of confidence) rather than to rely on the specific value of the estimate obtained from the sample. This can be done using the **sampling error**.

The **confidence interval** of an estimate is the range containing the census value X with a given level of confidence. Using both the estimate X' and its estimated sampling error $\sigma'(X')$, it is possible to construct a confidence interval, that contains the census value X with the given level of confidence.

Confidence intervals are usually given at a 95% level. These may be obtained as the range between $X' - 2\sigma'(X')$ and $X' + 2\sigma'(X')$. It may be asserted with 95% confidence that the census value lies in this range.

A higher or lower level of confidence may be calculated as follows:

α	67%	80%	90%	95%	99.5%
$K(\alpha)$	1.0	1.3	1.7	2.0	2.8

$K(\alpha)$ (the number of standard errors – plus and minus) is determined according to the required level of confidence, α .

Confidence intervals are generally symmetric around the estimate. However, for estimates based on a small number of cases in the sample (less than 40), confidence intervals are not symmetric. In such cases, both the estimate and its sampling error are subject to high errors.

The Methodological Appendix contains tables of **approximate** sampling errors with instructions on how the tables may be used to obtain sampling errors of the various estimates presented in this publication, to construct confidence intervals, and to compare estimates from exclusive groups.

The approximate sampling errors were determined by the **design effect** on the sample of various groups of the population. **The design effect** is defined as the ratio of the sampling variance (the square of the sampling errors) of the estimate in a complex sample to the sampling variance obtained had the sample been a simple random one of the same size.

It should be mentioned that it is sometimes more convenient to measure the accuracy of the estimate in terms of the **relative sampling error**, defined as the sampling error divided by the estimated value.

To caution the reader against using estimates prone to high errors, estimates with relative sampling errors exceeding 20% (figures smaller than 2,000) are enclosed in round brackets.

2. Non-Sampling Errors

Non-sampling errors may stem from many sources in the various stages of collecting and processing the survey data and may occur equally in a full census.

The main non-sampling errors in this survey are:

- a. **Errors stemming from non-response:** Errors caused by the fact that households are not investigated due to absence from home or refusal to participate. This may cause some bias in the estimates, since the characteristics of persons belonging to these households may differ from those of persons who were investigated.
- b. **Response errors:** Errors due to misunderstanding the question, unwillingness or inability to answer correctly or incorrect presentation of questions.
- c. **Errors in processing:** Errors that occur at the stage of processing the material, such as errors in coding and in the data entry process of the questionnaires. Some of these errors are corrected by means of checks that the material undergoes.
- d. Some of the households were interviewed in a week which was not the “**determinant week**” (as defined in Chapter D, section 2). This also causes a bias in the estimates.
- e. In the estimates of vacant dwellings, there may be another type of error relating to the distinction between "absent" and "vacant dwelling," which is not always clear. This might be due to differences in the way that different interviewers define the dwelling and report the data.

In contrast to sampling errors, which can be estimated on the basis of the survey data, non-sampling errors are difficult or even impossible to estimate. It is important to note that in the stages of planning and conducting the survey, every effort was made to minimize these errors.

DEFINITIONS, CLASSIFICATIONS AND EXPLANATIONS

A. Population and Labour Force

1. **Population** – the survey population is the permanent (de jure) population of Israel aged 15 and over.

The survey population **includes**:

1. Permanent residents living in Israel;
2. Permanent residents living abroad continuously for a period of one year or less;
3. New immigrants and potential immigrants, from the moment of their arrival in Israel;
4. Tourists, volunteers or temporary residents living in Israel continuously for more than a year;
5. As of 1968, residents of East Jerusalem;
6. As of 1972, the population of Israeli localities in the Golan Sub-District; as of 1982, all the residents in this sub-district;
7. From 1972 to 2005, the population of Israeli localities in the Judea and Samaria and Gaza Areas; as of 2006, not including the Gaza Area.

The survey population **does not include**:

1. Permanent residents living abroad continuously for more than a year;
2. Tourists, volunteers and temporary residents living in Israel continuously for a year or less;
3. Foreign diplomats and UN people.

2. **Population of households:** The tables refer to all households, with the exception of households in kibbutzim, institutions, student dormitories, and households of people living outside localities (Bedouins in the South). The tables relating to households by housing density do not include absorption centers and hotels populated by immigrants.

3. **Household:** One person or a group of persons living together in one dwelling on a permanent basis most of the week, who have a common expense budget for food. A household may include persons who are not relatives.

A household includes:

- a. All of the people belonging to the survey population and children under age 15 who usually sleep in the dwelling at least four nights a week.

Of those who usually sleep in the dwelling less than four nights a week, household members include:

- b. A household member doing compulsory military service – including the Nahal “Fighting Pioneer Youth” brigade and Shalat (unpaid service to the community in a military framework) – or serving in the permanent army, who has no other permanent civilian address in Israel.

- c. A married person living away from a dwelling that is the couple's permanent address due to work or studies, but whose spouse resides in the dwelling (not including couples living separately).
- d. Crew members of aircraft and ships whose permanent address is the above-mentioned dwelling, where they sleep when they are in Israel.
- e. A family member residing in the sampled dwelling at the time of the interview, who has no other permanent address in Israel.
- f. A former household member who moved to a senior citizens' home one month or less before the interview.
- g. A household member who has been staying in a hospital for one month or less.
- h. A household member who has been staying abroad continuously for one year or less.
- i. An unmarried household member who has been away from the dwelling for less than a month due to vacation, work, or a short-term course, and who has no other permanent address in Israel.
- j. A household member studying at a civilian or military boarding school, as well as persons living in student dormitories who were at their parents' home at the time of the interview – if the interview was conducted during the summer vacation.
- k. A household member who is in prison (including an institution or work farm), or who has been living at an institution for people with disabilities (those who are blind, deaf, or with retardation) for one month or less.

A household does not include:

- a. A married spouse who has left the dwelling and does not intend to return (i.e., a spouse living separately, even if not yet divorced).
- b. A married person living at an address other than that of the family (the spouse and children) due to work or studies, even if that person sleeps at this address most of the week.
- c. A household member enrolled at a boarding school, as well as a person living in student dormitories if the interview was conducted during the school year.
- d. A family member staying on a kibbutz while serving in the Nahal ("Fighting Pioneer Youth" brigade) or engaging in volunteer service in a pre-military framework.
- e. A family member who is staying in the sampled dwelling temporarily, but who lives in another dwelling most of the year which serves as their permanent address.
- f. A family member who moved to a senior citizens' home over a month prior to the interview.
- g. An unmarried family member who has been away from the dwelling, and who sleeps at a different (civilian) address in the country most days of the week.
- h. A family member who has been hospitalized for more than a month.
- i. A family member who is in prison (including an institution or work farm), or who has been living at an institution for people with disabilities (for those who are blind, deaf, or with retardation) for more than one month.

4. **Size of household:** Determined by the number of persons in the household according to the above definition.

5. **The determinant week** is the week ending on the Saturday preceding the survey interview.

6. **Characteristics of the weekly labour force**

6.1 Weekly labour force: Persons aged 15 and over who were “employed” or “unemployed” during the determinant week, according to the definitions given below.

6.1.1 Employed persons: Those who worked (in Israel or abroad by an Israeli institution or company) for at least one hour during the determinant week at any type of work for pay, profit or other remuneration: all workers in kibbutzim (whether in services or other industries); family members who worked without pay in a family business for 15 hours or more during the determinant week; persons staying in institutions who worked for 15 hours or more during that week; persons serving in the army (compulsory military service or permanent army); persons temporarily absent from their work.

Employed persons are divided into three sub-groups:

- a. **Full-time workers:** Persons who worked 35 hours or more during the determinant week.
- b. **Part-time workers:** Persons who worked 1–34 hours during the determinant week.
- c. **Temporarily absent from work:** This group includes all those who were temporarily absent from their regular work throughout the determinant week, due to illness, vacation, army reserve duty, decline in the extent of work, labour dispute, temporary work stoppage (up to 30 days), or other reasons. The group does not include persons who were absent for only part of the determinant week.

Those who were temporarily absent from work are included in this group only if they had a formal affiliation to a workplace, i.e., if they are ensured of work with the same employer after the period of absence.

Those who were absent from work for over a year are not included in this group.

Note: The usual extent of employment – full or partial – is determined by the workers’ usual number of work hours (not in the determinant week).

6.1.2 Unemployed persons: Persons who did not work at all during the determinant week (even for one hour) and who actively sought work during the four weeks preceding the interview by registering with the Labour Exchanges of the Employment Service or by application to employers in person or in writing, or in any of the other ways mentioned below, and who would have been available to start work in the determinant week had suitable work been offered (“availability to work”), including those who were promised employment within 30 days.

Note: A person who was not available to work during the determinant week due to illness or reserve army duty is considered unemployed.

Unemployed persons are divided into two sub-groups:

- a. Those who worked in Israel or abroad for an Israeli institution or company during the 12 months preceding the survey interview.
- b. Those who did not work in Israel or abroad for an Israeli institution or company during the 12 months preceding the survey interview.

Ways of actively seeking work:

- Labour Exchange of the Employment Service
- Employment agencies as well as other labour exchanges
- Advertisements in newspapers, on the Internet, etc.
- Personal or written application to employer
- Friends or relatives
- Attempt to establish a business
- Sought work in other way

Note: Since unemployed persons may seek employment in more than one way, they are asked about each of the above possibilities.

6.2 Not in the weekly labour force: All persons aged 15 and over who were neither “employed” nor “unemployed” during the determinant week. This group includes: students who did not work for even one hour during the determinant week; persons employed in voluntary work who received no compensation; or abroad for a non-Israeli institution or company; persons who cared for the children, family members, or the household and did not work for even one hour outside of the home; persons unable to work, and persons living on a pension or other allowance who did not work for even one hour during the determinant week. Also included in this group are family members who worked without pay in a family business for less than 15 hours during the determinant week, and persons in institutions who worked less than 15 hours during the determinant week.

6.2.1 Discouraged workers: All persons aged 15 and over who were not in the weekly labour force but were interested in working, and could have started to work during the determinant week had they been offered suitable work (“availability to work”) and sought work during the 12 months preceding the survey but not over the four weeks preceding the survey for the following reasons: they believed there are no appropriate jobs for them in their field or in their area of residence in terms of wages, work hours, or interesting work; lack of appropriate experience or training; language difficulties or inappropriate age (too young or too old).

7. Characteristics of the Annual Labour Force

7.1 Annual labour force: All persons aged 15 and over who were in the weekly labour force, as well as those who worked in Israel or worked for an Israeli institution or company abroad during the year but were not in the weekly labour force.

7.2 Employed during the year: All persons aged 15 and over who worked in Israel or abroad for an Israeli institution or company for **at least one day** during the 12 months preceding the interview. People who worked less than one month are considered as those who worked for one month.

7.3 Not in the annual labour force: Not in the weekly labour force, and did not work at all in Israel, or worked abroad for a non-Israeli institution or company during the 12 months preceding the interview.

8. Working age: Men aged 15–66

Women aged 15–61

Until 2008: Men aged 15–64; women aged 15–59

Household with persons of working age: A household with at least one person of working age.

Household with persons above working age: A household with persons above working age only.

9. Children in household: Includes all children up to age 17 (inclusive) in the household. Does not include those aged 15–17 who are heads of households or spouses/partners of heads of households, or who have their own children in the household.

Note: in the Labour Force Surveys of 1998–2001, according to the weighting method that was used in the survey, Israeli-born children of immigrants who arrived in Israel in 1990 and after were included in the weighting strata as “non-immigrants”. Therefore the estimate obtained for immigrant children was lower than their actual number. As of 2001, processing was conducted in new weighting groups.¹

10. Number of rooms in dwelling: All rooms used by the household as living quarters. The following are excluded: kitchens, bathrooms, toilets, balconies, and rooms used for business or work only, as well as rooms rented to tenants. Until 1979, half a room was counted as a room; since 1980, a full record has been made of rooms and half-rooms. Therefore, data for 1980 were processed twice.

11. Number of persons per room (housing density): Calculated by dividing the total number of persons living in the household by the total number of rooms occupied by members of the household.

¹ See: Central Bureau of Statistics (2003). *Labour Force Surveys 2002, Current Statistics 9/2003*. Jerusalem: Author.

12. Average number of persons per household: Calculated by dividing the total number of persons in all households by the number of households.

13. Religion and population group: The first person in the list of household members in the questionnaire is the only household member who is asked about religion. The religion of the first person in the list is registered as the religion of all household members who have an Israeli identity card. Household members who do not have an Israeli identity card are asked about their religion. The classification according to religion includes: Jews, Moslems, Christians, Druze and other religions (other religions also include no religion or religion unknown). The classification according to population group includes: Jews, Arabs, and Others.

Until 2001 there were two population groups: "Jews" and "Other Religions." The group "Other Religions" included all those who replied that they are not Jews. Until the beginning of the 1990s, "Other Religions" mainly included Arabs. Following the wave of immigration in the 1990s, "Others" was added to this group (see below). As of 2002, the group "Other Religions" was divided into two population groups:

- Arabs: a. Live in non-Jewish localities; or
 b. Live in Jewish or mixed localities, were born in Israel or arrived in Israel before 1990.
- Others: Live in Jewish or mixed localities, and arrived in Israel in 1990 or after.

14. Years of schooling: The number of years spent **in regular studies in school**, excluding studying on one's own or attending irregular courses. Only completed years of schooling are considered. If a person was studying at the time of the interview, that year is also counted.

15. Type of school last attended: The type of school last attended by the participant, even without completing studies there.

16. Highest diploma (degree) received: The highest diploma that a person received from a school or from educational settings that grant official diplomas (not including certificates for completion of courses, certificates for completion of in-service training, etc.).

17. Head of household: In the tables of the Labour Force Surveys, the head of household is the economic head of household, i.e., the main wage earner of the household.

As of 1995, the definition of head of household was changed, and is now determined by *extent of participation in the labour force and extent of employment, irrespective of age, sex, or income*.

The head of household is the employed person who usually works 35 hours or more a week (first preference), an employed person who works up to 34 hours a week (second preference); an unemployed person (last preference).

If more than one person in the household fits the definition of head of household, or if no household member fits the definition, the head of household is determined by the interviewee.

Notes:

- The head of household is a person aged 18 and over (except households where the only wage earner is aged 15–17, and households with persons aged 15–17 only).
- A caregiver living in the dwelling will not be defined as the head of the household, except in households with one person.

18. Number of children, by age group: Information is obtained on the number of children of each female in the household and the total number of children in the household, by the children's ages.

19. Work hours per week: The number of hours that employed persons actually worked during the determinant week, including: overtime in the same workplace or in other workplaces, preparation hours (for teachers and artists), and waiting hours (e.g., for drivers or porters), as well as work hours of a non-paid family member in the family business or farm (if the person worked 15 hours or more that week).

Average work hours per week is obtained by dividing the total number of weekly work hours of all employed persons by the number of employed persons. This average is calculated both for all employed persons (including those temporarily absent from work) and for employed persons, excluding those temporarily absent from work.

20. Type of locality: The data by type of locality are presented for 2012 on the basis of population estimates of localities as per 2011. Localities are divided into two main groups, which are distinguished according to the size of the locality (number of residents):

- a. **Urban localities**, in which there are 2,000 or more residents. These localities are classified into sub-groups by size;
- b. **Rural localities**, in which there are less than 2,000 residents, which are classified into three types of localities:
 1. Kibbutzim;
 2. Moshavim and collective moshavim;
 3. Other rural localities.²

21. Development localities: Included are the localities specified in the regularly updated regulations based on the "1963 Severance Pay Law."

The 25 localities that are included in the Labour Force Survey data are listed below:

Development localities in the North: Afula, Akko, Bet She'an, Hazor HaGelilit, Karmi'el, Ma'alot-Tarshiha, Migdal HaEmeq, Nazerat Illit, Qiryat Shemona, Shelomi, Tiberias, Yoqne'am Illit, Zefat.

Development localities in the South: Arad, Bet Shemesh, Dimona, Elat, Mizpe Ramon, Netivot, Ofaqim, Qiryat Gat, Qiryat Mal'akhi, Sederot, Yavne, Yeroham.

² For further details, see: Central Bureau of Statistics (2014). *Statistical Abstract of Israel 2014*, No. 65. Jerusalem: Author, Introduction – Chapter 2.

- 22. District and sub-district:** The districts and sub-districts are defined according to the official administrative distribution of the country, according to which there are 6 districts and 15 sub-districts.

Includes Israeli localities in the Judea and Samaria Area.

In 1972, the Judea and Samaria and Gaza Areas were added, in order to characterize the Israeli localities and their population, found in these areas. The data for 2005 relate to the residents of the Judea and Samaria Area, and do not reflect changes in the population following the evacuation of the Israeli localities in the Gaza Area and northern Samaria, under the Disengagement Plan Law 2005.

As of 2006, as indicated in section 1, only the Judea and Samaria Area is included.

- 23. District and sub-district of work:** Employed persons were classified according to the locality in which they worked. Employed persons working in the Judea and Samaria Area were classified as a separate group.

24. Metropolitan areas

A metropolitan area is a large number of urban localities (municipalities and local councils) and rural localities in regional councils, which are adjacent to one another and constitute one functional entity that integrates economic, social, and cultural relations.

The metropolitan areas were divided according to their internal structure:

Core: The territory of the primary city serving as the focus of activity for the population of the metropolitan area.

Inner Ring: The area containing the localities surrounding the Core.

Middle Ring (in the Tel Aviv and Be'er Sheva Metropolitan Areas): The area containing the localities surrounding the Inner Ring.

Outer Ring: The area containing the localities surrounding the Middle Ring.

Sections (Northern, Eastern, Southern, Western): Sub-divisions of the metropolitan rings.

As of 1999, the labour force survey has used a new definition of metropolitan area, which replaced the former definition of conurbation. Two metropolitan areas were defined: The Tel Aviv Metropolitan Area, and the Haifa Metropolitan Area.

In 2001, the borders of the metropolitan areas were re-examined and, as a result, the borders of the Haifa Metropolitan Area were changed. **The changes in the Haifa Metropolitan Area** were made in the localities included in its outer ring: in the south the locality of Jisr Az-Zarqa was removed, and in the north it was decided to include all localities up to the Nahariyya line (inclusive). In the North-East of the outer ring, it was decided to include all localities in the Karmiel natural area and, in addition, the localities of the Misgav Regional Council. The borders of the **Tel Aviv Metropolitan Area** were not changed.

Be'er Sheva Metropolitan Area: In 2001, a plan was approved which defines the borders of a metropolitan area in the South, which is developing around the city of Be'er Sheva. The Be'er Sheva Metropolitan plan is similar to the contours of the other metropolitan areas, in that it is also divided into rings with sections in them. The rings are

defined by their distance from the centre of the metropolitan area (the “core”), which is the city of Be’er Sheva. The borders of the Be’er Sheva Metropolitan Area include the Northern Negev: from the border of the Be’er Sheva Sub-District in the north, up to Mitzpeh Ramon in the south; and from the border of the Gaza Strip and Egypt in the west, up to the Dead Sea and the Jordanian border in the east.

25. Commuting to work:

- a. **Commuter:** A person employed outside of his/her locality of residence.

There are four levels of commuting to work:

- Employed in the sub-district of residence;
- Employed outside of the sub-district of residence but within the district of residence;
- Employed outside of the district of residence, in one locality;
- Employed outside of the district of residence, in two or more localities.

- b. **Non-commuter:** A person employed in his/her locality of residence.

26. Vacant dwelling: A dwelling that is not occupied permanently for various reasons, such as: construction or renovations are being carried out; the dwelling is new or renovated and has not yet been occupied; the dwelling is demolished, sealed, or abandoned; the tenant passed away or moved to an institution; the dwelling is a holiday dwelling; the dwelling is only used occasionally.

B. Classification by Status at Work, Industry, Occupation

Employed persons (including those temporarily absent from work) are classified by their status at work, industry and occupation, according to their work during the determinant week. For unemployed persons and persons not participating in the labour force who worked in Israel or worked abroad for an Israeli institution or company during the 12 months preceding the survey, the data relate to their last work.

- 1. Status at work:** Since 1995, status at work is based on the classification of the International Labour Organization 1993.³

Employees: Persons working for another party in return for daily wages, monthly salary, piece work or work for any other kind of remuneration. Self-employed persons who are registered as a company and receive their wages from that company are classified as employees.

³ International Labour Organization (1993, January). *Resolution Concerning the International Classification of Status in Employment: ICSE-93*. Adopted by the Fifteenth International Conference of Labour Statisticians, Geneva. Retrieved from: www.ilo.org/global/statistics-and-databases/standards-and-guidelines/resolutions-adopted-by-international-conferences-of-labour-statisticians/WCMS_087562/lang-en/index.htm

Recipients of wages from employment agencies or employment contractors –

employees placed in jobs and receiving their wages from the employment agency or employment contractor, while the place of work they were referred to is responsible for implementation of the work.

The following are not included in this definition:

- Employees on the staff of the employment agency;

- Employees hired through a subcontractor. In these cases, the subcontractor bears responsibility for the implementation and quality of the work. These employees work mainly in the following industries (according to the 2011 Classification): Security Activities (Group 8010), Combined facilities support activities (Group 811), Cleaning activities (Group 812), and Home-care services (Group 882).

Employers: Persons employing other persons for payment or any other remuneration, or business partners employing others, including a farm owner employing workers for wages.

Self-employed: Persons working in their own business or farm, who do not employ others in return for wages or any other remuneration.

Members of cooperatives: Persons who, in addition to their salary, share in the profits of cooperatives or cooperative societies, including members of collective *moshavim*.

Members of kibbutzim: Persons living on kibbutzim and working there **without pay**, including candidates for membership, relatives of members who reside permanently in the kibbutz, and training groups. The classification does not include “volunteers”, i.e., people who are not kibbutz members but live and work there for wages or other remuneration. Kibbutz members who work for pay outside the kibbutz are classified as employees.

Unpaid family members: Family members or other relatives working in the family business 15 hours or more during the determinant week without any kind of remuneration. A family member receiving wages is considered an employee.

2. Industry: Industry is determined by the nature of the establishment or institution (the “classification unit”) where the person is employed. The industry is determined by the economic activity of the classification unit.

If an establishment covers more than one industry and the various activities can be separated according to “classification units” (e.g. a textile business that engages in spinning, weaving and sewing, or an institution such as a municipality), the industry is determined by the type of activity of the unit in which the employed person works.

A subsidiary unit that only serves the needs of the establishment and does not have an accounts department of its own is not considered a separate classification unit.

If the establishment is engaged in several types of economic activities that cannot be separated according to departments, the industry of the establishment is determined by its main economic activity.

Persons employed in kibbutzim were classified according to the industry of their activity.

From 1995 to 2012, employed persons were classified according to the 1993 classification of industries,⁴ which is based on the United Nations International Standard Classification 1990.⁵

Following the transition to the second edition of the 1993 classification of industries,⁶ it was found necessary to adjust some coding rules, primarily in the case of establishments engaging in more than one activity. As a result, the industries were recoded.⁷

Since 2013, employed persons have been classified according to the 2011 classification of industries,⁸ which is based on the United Nations International Standard Classification 2008.⁹

In this publication, the data for 2012 are not presented according to the Standard Industrial Classification of All Economic Activities 2011 (except for Table 53, Chapter 2). Data for 2012 and data for 2013 will be presented according to the new Standard Industrial Classification in the next publication.

High technology industries: The definition of high technology industries is based on the Standard Industrial Classification of All Economic Activities 1993,¹⁰ as well as on the definitions of OECD and Eurostat.¹¹

¹¹ See “Recommendations of the Subcommittee for Official Classification of High Technology Industries in Israel – Definition of High Technology Industries.”
www.cbs.gov.il/publications/hitech/hi_class_heb.pdf

The following are defined as high technology industries in Israel according to the 1993 Standard Industrial Classification:

Code	Name of Industry
Manufacturing in the High-Tech Sector (High-Tech Industry)	
245	Manufacture of pharmaceutical products for human and veterinary uses
30	Manufacture of office and accounting machinery and computers
32	Manufacture of electronic components
33	Manufacture of electronic communication equipment
34	Manufacture of industrial equipment for control and supervision, medical and scientific equipment
355	Manufacture of aircraft
Services in the High-Tech Sector (Knowledge-Intensive High-Tech Services)	
66	Telecommunications
72	Computer and related services
730	Research and development in natural sciences

Industries defined as high technology industries according to the 2011 Standard Classification:

Code	Name of Industry
Manufacturing in the High Tech Sector (Manufacturing)	
21	Manufacture of pharmaceutical products and homeopathic pharmaceutical preparations
26	Manufacture of computer, electronic and optical products
303	Manufacture of air and spacecraft and related machinery
Services in the High-Tech Sector (Knowledge Intensive High-Tech Services)	
61	Telecommunications
62	Computer programming, consultancy and related activities
631	Data processing, hosting and related activities, web portals
720	Research and development centres
721	Research and development in engineering and natural sciences

3. **Occupation:** Activities carried out by the employed person at the workplace, regardless of any trade that the person learned, if the person does not practice it.

As of 1995, interviewed persons were classified according to the 1994 classification of occupations,¹² which is based on the classification of the International Labour Office (ILO).¹³

As of 2013, employed persons are classified according to the Classification of Occupations 2011,¹⁴ which is based on the International Standard Classification of the ILO 2008.¹⁵

In this publication, the data for 2012 are not presented according to the Standard Industrial Classification of All Economic Activities 2011. Data for 2012 and data for 2013 will be presented according to the new Standard Industrial Classification in the next publication.

C. International Comparisons

The tables in Chapter 11 present comparative data on persons participating in the labour force, on unemployed persons, on the employment rate (calculated as the percentage of employed persons in the total population), and on employees in high-tech industries.

The data in Tables 11.1, 11.2 and 11.3 were obtained from the dataset of the International Labour Organisation (ILO).

Owing to minor differences in the survey populations examined in different countries, the comparison is not exact. The differences derive from two main sources: inclusion or exclusion of persons serving in the army (compulsory and permanent) in the labour force; and age boundaries (e.g., in Israel, the survey population consisted of persons aged 15 and over, and in the US it consisted of persons aged 16 and over). In the tables, there are precise notes relating to the population covered in each country, as indicated in the ILO publication.

The definition of unemployed persons conforms with ILO definitions. The estimates are adjusted using a method based on a common and precise definition of unemployed persons. Once a year, member countries supply data based upon identical questions that appear in labour force survey questionnaires. As of 1995, the definitions in Israel conform with those of the ILO.

The data in Table 11.4 were taken from the database of the EUROSTAT.

¹² A detailed explanation on the new classification of occupations appears in CBS (1994). *The Standard Classification of Occupations 1994*. Technical Publications Series, No. 64. Jerusalem: author.

¹⁵ International Labour Office (2012). *International Standard Classification of Occupations: ISCO-08*. Geneva: Author.

D. Job Vacancies and Supply and Demand in the Labour Market (based on the Job Vacancy Survey¹⁶ and the Labour Force Surveys)

- 1. Job vacancy:** A job that is unoccupied, including a job that is newly created. Also includes a currently occupied job that is about to become vacant following retirement, resignation or promotion of the worker currently occupying the position, which is open to candidates outside the organization, and for which the employer is taking active steps to find a suitable candidate (through want ads, through employment agencies, or through direct recruitment).

Includes:

- A full or part-time job;
- A temporary job for which the person occupying the position is intended to temporarily replace the current worker due to absence (e.g., maternity leave, prolonged illness);
- A job for workers hired through employment agencies.

Does not include:

- A job that has remained vacant due to the temporary absence of the current worker, until that person returns to work;
- A vacant job that is open only to internal candidates from the organization;
- An unpaid job, without profit or without any other compensation (volunteer work);
- A job vacancy for subcontractors or consultants;
- A job vacancy abroad.

Workers hired by through employment agencies are reported by the place of work and not by the employment agency, except for staff members of the employment agency who are reported by the agency.

Workers employed by a subcontractor are reported by the subcontractor and not by the actual place of work.

Permanent job: A job that is not seasonal or temporary, and that is not expected to be eliminated within the next six months.

Full-time job: Determined in accordance with the company's or organization's job definition.

¹⁶ For explanation about the survey methods, see: Central Bureau of Statistics (2014). *Statistical Abstract of Israel 2014*, No. 65. Jerusalem: Author, Introduction – Chapter 12.

Job vacancy rate: The ratio of total jobs in Israel to the overall volume of employment in the country, that is, the number of job vacancies divided by the total number of occupied employee jobs plus the number of vacancies.

Survey population: The survey population included a sample of businesses that represent most of the industries in Israel. The size range of the businesses varies, from small businesses (with 5+ employee jobs) to leading companies in Israel.

Industries are determined in accordance with the *Standard Classification of All Economic Activities 1993*. The industry refers to the industry that the business belongs to. If the business engages in several economic activities, the industrial classification is determined according to the main activity defined by the employer.

The survey population did **not include**:

- Small businesses with less than five employee jobs;
- Agriculture (Category A);
- Public Administration (Category J);
- Manufacture of Diamonds and Extraterritorial Organizations and Bodies (Divisions 37 and 99, respectively);
- Primary Education Institutions and Secondary Education Institutions (Incl. Intermediate Schools) (Groups 801 and 802, respectively);
- Pre-primary Education Institutions (Kindergartens) and Child Day-Care Activities (in Homes) (Classes 8000 and 8611, respectively);
- The Israel Broadcasting Authority, the Employment Service, and the Israel Institute for Biological Research;
- The General Government Sector (financial corporations for development of local authorities, public housing corporations, etc.)

The population **includes** government hospitals.

2. Supply and Demand in the Labour Market

Labour demand: The number of job vacancies.

Labour supply (according to the Labour Force Survey): Employees (including members of cooperatives) who worked in the 12 months preceding the survey and sought work, including: those who work part-time involuntarily (sought full-time work and didn't find), unemployed persons, and those not in the labour force.

Supply and demand ratio: The ratio of employees (including members of cooperatives) who worked in the 12 months preceding the survey and sought work, to the number of job vacancies.

It is important to note:

- The labour supply by occupations is underestimated. Among the population of employees who are looking for work (labour supply), those with a known occupation accounted for approximately 54% of the total supply in 2012. The estimate does not cover the following: persons who worked in the past (before the last 12 months) or never worked in Israel at all (immigrants, housewives, students who recently finished school, etc.) and sought work; and employed persons who usually work in a full-time job and sought other work.
- The annual data are presented for occupations in which there were 5,000 employed persons and over (in the last year) according to the Labour Force Survey estimates, and for which the vacancies constituted at least 5% out of all job vacancies at the Major Group (one digit level in the Standard Classification of Occupations) in the last year and are presented in the table according the Job Vacancy Survey.
- In uncommon occupations (less than 500 job vacancies), there may be fluctuations over time, which will affect the supply to demand ratio.
- The data published in Tables 5.8–5.10 cover over 95% of all job vacancies in most major groups.

Explanation of the Main Changes in the Labour Force Survey:
Monthly Survey Structure Compared with Quarterly Survey Structure
- as of January 2012

The major changes are summarized in the table below.

Table A. - Main Changes in the Labour Force Survey (Monthly Survey Compared with Quarterly Survey)

Subject	Quarterly Survey	Monthly Survey
Definitions of labour force characteristics	Characteristics of the <u>civilian</u> labour force	Characteristics of the <u>entire</u> labour force (including those in military service – compulsory service or permanent army)
Mode of investigation	Each dwelling is investigated four times: Two consecutive quarters, a break of two quarters, and two more consecutive quarters.	Each dwelling is investigated eight times: Four consecutive months, a break of eight months, and four more consecutive months.
Current sample size	Approximately 22,500 persons in <u>a quarter</u> on an ongoing basis.	Approximately 21,500 persons in <u>a month</u> on an ongoing basis
"Permanent" samples	Sub-sample of approximately 3,900 persons from the sample census file (social-economic data) of the 1995 Population and Housing Census.	Approximately 26,000 persons from the sample census file (social-economic data) of the 2008 Population Census.
Main sampling frame	Municipal tax files	Building and Dwelling Register after anchoring dwellings to statistical areas
Use of spatial information for drawing the main dwelling sample	Sort files by geographical information from the municipal tax files	Integration of the statistical area obtained from a procedure of anchoring dwellings, in addition to the geographical information in the municipal tax files
Number of sample localities	Approximately 370 localities in a quarter	Approximately 470 localities in a month
Investigation period per sampling unit	The determinant week and three more weeks	The determinant week and one more week
The estimation method	No use of information on labour force characteristics from previous stages of the survey	Using a composite estimator based on, among other things, information on labour force characteristics from a previous stage of the survey, changing the weighting strata (such as eliminating a separate weighting strata for immigrants)

Transition to a Monthly Labour Force Survey

Questions and Answers

General

As of January 2012, the Central Bureau of Statistics (CBS) has made a transition from a quarterly system of measuring labour force characteristics to a new and improved system that better suits the latest international recommendations on employment and unemployment. The principal changes were: adjusting the definition of the population, significantly increasing the monthly samples, geographic expansion and using more advanced statistical methods in the sampling, both in the questioning model and in data estimation. These changes, based on the science of statistics, led to many changes in logistics and operations, such as improved technological systems, expansion of the work teams, interview methodology, work procedures, etc. With the transition to the new system, and as often happens in the case of updating and in this case revolutionizing a statistical series, a "break in the series" was formed. The ability to compare the past with the present became even more difficult and requires extreme care.

With the transition to the monthly survey, changes in levels of the employment indices occurred. In other words, the indices of participants in the labour force, employed persons and unemployed persons have changed in comparison with the past. The break in the series was due in the most part to the aforementioned reasons, i.e. the changes were the result of a revolutionary change in measurement. They were not due to changes in economic phenomenon at that time; therefore, the trend found in the monthly survey is the same as the past trend.

In addition, it should be emphasized that in terms of the official data of Israel, the data that were published in the past are the official data for the previous series and from now on the official data are those published based on the new series. In order to allow a careful comparison for continuous trend analysis, special coefficients were calculated that allow the comparison. The new data do not negate the validity, reliability or quality of past data that were based on the best methods available at the time.

Although it sounds strange, it should be noted that statistically it is possible that there is no difference between the numbers of the past and the present numbers. As known, in statistics there are sampling errors that may lead to the official numbers presented moving up and down approximately 0.5%, by using different samples to measure the same phenomenon, at the same time of the calendar year. Additionally, there are many different psychological influences related to the work methods of the survey, both from the aspect of the questioners and the respondents. Thus, the importance of examining trends over time in official statistics becomes apparent. Extreme care must be taken in using absolute data and the rates that are derived from them.

Now will be present some questions about the transition from the quarterly to the monthly labour force survey.

Question: Why did the CBS decide to make the transition from a quarterly to a monthly labour force survey?

A quarterly survey is a survey in which country-wide sample coverage is completed each quarter, whereas in a monthly survey the sample coverage is completed each month. Until December 2011, the CBS released monthly data based on a quarterly survey. The result is that it was not possible to distinguish if the changes that were noted in the monthly data during a quarter were a result of partial sample coverage or were a true change in the employment and unemployment rate. The decision to change the survey was made in order to improve the published data and to provide a better database for decision makers and other users. A monthly survey requires a larger sample (about three times larger), covers more localities and therefore, we believe, better reflects the market condition than the quarterly survey.

Other factors that led to the decision to make updates in the Labour Force Survey relate to the recommendation of the ILO (International Labour Organization) to make changes in the measurement method (accordingly, to measure the entire labour force). The recommendation was first presented by the ILO in the mid 1980's. About two years ago, Israel ratified Convention 160 of the ILO, concerning international standards for data reporting processes of labour market statistics (Labour Statistic Convention, 1985). At the same time, Israel began the process of joining the OECD, which brought with it an examination of processes by international experts. These experts, together with experts from Israel that supervise the official statistics, recommended that the CBS adopt the approach of **measuring the entire labour**

force and the transition to a monthly Labour Force Survey instead of the quarterly survey that had been in place.

The process of planning, methodology development, and adjusting computer systems took approximately six years. The transition process was done under the ongoing supervision of the Public Council for Statistics and the method was presented to experts and public representatives. In April 2011, we began the transition process that took approximately six months, and the two surveys were running concurrently in the last quarter of 2011.

Question: What caused the differences between the monthly and the quarterly survey and is there is a central factor explaining the differences in estimates according to the monthly survey compared to data that was published from the quarterly survey?

The differences between the findings of the two surveys are due to a large number of factors and therefore it is difficult to compare them. The factors include:

1. **Transition from civilian labour force to entire labour force** (including the military) to improve the comparisons to data published by other countries. In order to not publish data on the size of the military, transparency is somewhat compromised with regard to the size of sub-populations and data relating to industries.
2. **In the monthly survey the population was updated according to the results of the latest Population Census and so the size of the population and its characteristics changed between the surveys.** For example, the result of examining civilian labour force data between the two surveys is that there is an increase in the number of employed persons and the number of those who sought work in both surveys, but the number of those who sought work increased at a higher rate.
3. **The monthly survey includes more localities in the periphery than the quarterly survey.** If employment and unemployment rates are different in the types of localities then it might cause differences in the results between the two surveys.
4. **The ratio between those who respond by phone and those who respond by face to face interview has changed between the two surveys.** A difference in the responses received by phone survey compared to those in a face to face interview might influence the results of the survey. People tend to

answer differently in face to face interviews as compared to answering by telephone which allows a certain degree of anonymity.

There are other hypotheses about the causes of the differences but the probability that they would influence the differences between the surveys is lower. Better analysis and an attempt to quantify more exactly the causes and extent of the differences will be a process that accompanies the new survey, not only at the start of the survey but from the perspective of time as well.

It should be emphasized that the trend of the changes in employment and unemployment between the two surveys is identical and the main difference is in the base point (in other words the absolute data or the levels calculated in percentages) from which the trend is calculated. Therefore, from the current findings it can be assumed that the difference between the surveys is in the base point and not in changes over time.

The CBS, in a Press Release, has presented the differences between the surveys – differences that explain the gaps between the series. The main factors were:

1. **Sample factors**: The design of the survey sample (including the rotation method), sample size, geographic distribution of the sample, sample distribution in the localities, use of additional variables in the sampling process, change of permanent samples in the survey (institutions and those who live outside of the localities) etc.
2. **Data collection process factors**: The difference between face to face interview collection compared with phone interview, increase in the number of interviewers, change in the profile of the interviewers, logistics including change in the structure of the unit that deals with data collection, addition of new modules of computerized management of the survey, shortening the investigation period of the questionnaire, changing the size of the interviewer's workload, changes in questioning method in the repeated stages on the work place and profession, imputations from previous stages in the demographic data and education data etc.
3. **Data cleansing process (reviews and editing) factors**: Building new computer systems, the addition of testing on demographic variables compared with Population Register data, adding logical inspections that test the correlation of the reported data in various stages, using an automatic coding system for industry and occupation, etc.

4. **Calculation of weighting coefficients factors**: Changes in the weighting method, in calculating population estimates in order to calculate weighting coefficients and in the weighting cells.
5. **Changes in the definition of labour force characteristics factors**: Transition to a measurement of the characteristics of the entire labour force instead of the civilian labour force. Adding those who are serving in the army (compulsory or permanent) to the labour force as full time employed persons.
6. **Seasonal adjustment and trend calculation factors**: Transition to seasonal adjustment of a monthly series, using monthly data from the quarterly survey, etc.

Question: Do OECD countries measure labour force characteristics differently than Israel?

Measurement of labour force characteristics world-wide is made according to the recommendations of the International Labour Organization – ILO (including OECD countries). There is no separate method of measurement in the OECD countries.

Since the beginning of Labour Force Survey in the 50's and 60's the survey was conducted according to the recommendations of the ILO. In the ILO there are two methods of measuring labour force characteristics, one in which the civilian labour force is measured and the second in which the entire labour force is measured (including those who serving in the army - compulsory or permanent). In Israel, it was decided at the beginning to use the measurement of the civilian labour force. This was the method conducted until the end of 2011.

Question: Are there other countries that underwent a similar process, a transition from a quarterly Labour Force Survey to a monthly Labour Force Survey, and what were the results of this transition?

An examination of database of ILO shows that Australia underwent a similar process in the years 1977-1978. The quarterly survey was conducted simultaneously with the monthly survey for one month. The results were that the unemployment rate in the last quarter of 1977 was 5.5%, and the unemployment rate in February 1978 was 7.5%.

Question: What is the recommended method for analyzing historical data of the labour market? Is it possible to work with chaining coefficients on data in a seasonally adjusted and trend series?

Running the two surveys simultaneously in the 4th quarter of 2011 allows a calculation of the chaining coefficients between the data obtained from the monthly survey and the data obtained from the quarterly survey. A detailed explanation including an example of calculating chained data was published in the Press Release 081/2012 "**Labour Force Survey Data, February 2012**". In addition it should be noted that the chaining coefficient can be used on a seasonally adjusted and trend series. In order to calculate relative measures based on chained data, one must first calculate chained data in each series (for which one wishes to calculate the relative index) and only afterwards calculate the relative index. For example, in order to calculate the chained unemployment rate, a chained figure should be calculated for the series of participants in the labour force, according to the chaining coefficient of the series, and a chained figure for the series of unemployed persons according to the chaining coefficient of the series should be calculated, and only afterwards the unemployment rate of the labour force can be calculated, according to the chained data.

Chaining Coefficients between Quarterly and Monthly Labour Force Survey Data

With the transformation to a monthly Labour Force Survey, a "fracture" was formed in the data series, the origin of which was changes in the methodology of the survey and the definitions of the labour force characteristics.

In order to ensure a comparison of the data, chaining coefficients of the series presented in the tables attached to this Press Release are detailed below (see Table B). They are to be used as follows:

To obtain an estimate adjusted to the definitions of the monthly survey, the corresponding estimate that was obtained in the 4th quarter (in the quarterly survey format) should be multiplied by the corresponding chaining coefficient, as in Table B.

The percentage of change is calculated as the difference between the estimate obtained in January 2012 (based on the monthly Labour Force Survey) and the corresponding estimate of the 4th quarter of 2011 (obtained after multiplying by the chaining coefficient), divided by the 4th quarter estimate (after multiplying by the chaining coefficient).

For example:

The estimate of the number of participants in the civilian labour force in the 4th quarter of 2011 stood at 3,216,200. To obtain an estimate of the participants in the labour force in the 4th quarter of 2011 that corresponds to the definitions of the monthly survey, one multiplies by the chaining coefficient that corresponds to this estimate in the Table: 1.091. The result is 3,508,800.

In January 2012 the number of participants in the labour force was 3,523,400.

The percentage of change between the quarterly estimate, correlated by means of the chaining coefficient, to the estimate obtained in January is:

$$\frac{3523.4 - 3508.8}{3508.8} * 100 = 0.42\%$$

Thus, in January 2012 there was an increase of 0.4% in the labour force, compared with the 4th quarter of 2011 (an addition of approximately 15,000 persons).

MONTHLY LABOUR FORCE SURVEY

Year _____

Stage _____

No. of households in dwelling _____ →

See the note on page 5

Month _____

Date of interview _____

Week _____

Questionnaire No.

Locality code			

Year of the sample	

Month	

No. of dwelling		

Change tenants

Full name _____

Address _____

Name of locality _____

Update of name and address

Is the address listed above complete and correct?

1. Yes
2. No (please list the correct address, street name and building number)

Are there any other details in the address that need to be updated (e.g., entrance, floor, new / additional street name, additional building number)

1. Yes
2. No

Entrance _____

Floor _____

Dwelling number _____

Additional number for the building _____

Building number on the street that the building faces _____

Updated name from the mailbox _____

Comments _____

Different street name _____

New building number _____

The building faces another street _____

The dwelling you live in has been included in the sample of the Labour Force Survey – a survey that is conducted in several stages. The main goal of the survey is to examine the situation of employment in the country. The next stages in the survey will conduct by phone. What is your telephone number for contact (with last name)?

Telephone numbers for contact: 1. Name _____ Tel _____

2. Name _____ Tel _____

3. Name _____ Tel _____

Does the _____ family live at this address?

1. Yes
2. No, another family lives there

Continue filling out the questionnaire

Table 1

- A. Of the persons living in the dwelling, list the ones for whom this address is registered as their permanent residence in Israel** (including soldiers, people currently staying abroad, and people in boarding schools or institutions)?
- B. Are all the people you specify lived in this apartment on December 31, "previous year"?**
1. Yes – *Go to question "C"*
 2. No – *Go to column 04.1*
- C. Do all of them have a common expense budget for food?**
1. Yes – *Go to question "E"*
 2. No – *Go to question "D"*
- D. Fill out annex of additional households in a dwelling (see the note on page 5).**
- E. Do all of the people in the household sleep at the dwelling at least four nights a week?**
1. Yes – *Continue filling out the table*
 2. No – *Go to Table 2.*

Person No.	First name	Last name	How are you related to ____? <i>Read the first name on the list</i> <i>In households with more than one nuclear family, list the person no. of the spouse and parent next to the relationship status</i> <i>Go to "B"</i>	Specify the people who didn't live in this apartment on December 31, "previous year"? <i>Continue to "C"</i>	Sex 1. 2.000 Mark the person number of the individual who provides the information (if that person is not a member of the household, mark "98", and indicate that person's name and relationship to the people who live in the dwelling _____)

2.130 (If age 24 or less and Single) Interviewer: Fill in the person number of the individual's mother (if his mother does not appear in the table mark "98")

98 - continue to **2.131**, other - go to **2.150**

2.131 Mark the reason why his mother does not appear in the table:

1. Stays abroad
2. Lives at another dwelling in Israel
3. Stays at an institution (like Nursing Home)
4. Deceased
5. Other, specify: _____

2.140 (If number of mother 98 or unknown) Interviewer: Fill in the person number of the individual's father (if his father does not appear in the table mark "98")

98 - continue to **2.141**, other - go to **2.150**

2.141 Mark the reason why his father does not appear in the table:

1. Stays abroad
2. Lives at another dwelling in Israel
3. Stays at an institution (like Nursing Home)
4. Deceased
5. Other, specify: _____

2.150 (If Married) Interviewer: Fill in the person number of the individual's partner (if his partner does not appear in the table mark "98")

98 - continue to **2.160**, other - go to **2.120.1**

2.160 Mark the reason why his partner does not appear in the table:

1. Stays abroad
2. Lives at another dwelling in Israel
3. Stays at an institution (like Nursing Home)
4. Deceased
5. Other, specify: _____

Note: If there are more than one household in dwelling the following questions are asked for each one of them: relationship within the household; how many rooms does the household live in; do they employ domestic help or a caregiver for pay; did the domestic help or caregiver work last week and if yes - how many hours

2.120.1 What is the main lifestyle in terms of religion of those who live in the apartment?

1. Non-religious, secular
2. Traditional
3. Religious
4. Very religious
5. Ultra-religious ("Haredi")
6. Mixed lifestyle
7. Other _____

2.180.1 How many rooms does the family (household) live in (including half-rooms and salon)?

2.181 Do you own the dwelling in which you live, or is it rented? ["Owned": by at least one of the persons living in the dwelling]

1. You own it - *Go to 2.190*
2. You rent it – *Continue to question 2.183*
3. Assisted living - *Go to 2.190*
4. Living rent-free in dwelling of someone's else property (including kibbutz) - *Go to 2.190*
5. Key money apartment - *Go to 2.190*
6. Other, specify _____ - *Go to 2.190*

2.183 From whom did you rent the apartment?

1. A private individual
2. A public housing company: 'Amidar', 'Prazot', 'Halamish', 'Shikmona', etc.
3. Educational institutions, such as dormitories or yeshivot
4. Government, a local authority, kibbutz or moshav, etc.
5. Other, specify _____

2.190 In your home, do you employ domestic help or a caregiver for pay?

1. **Yes** – *Continue to question 2.200*
2. **No** – *Go to the questionnaire, Item No. 1*

2.200 Did the domestic help or caregiver work last week?

1. **Yes** – *Continue to question 2.210*
2. **No** - *Go to the questionnaire, Item No. 1*

2.210 How many hours did they work last week? _____

Questions 2.250 – 2.290 are asked:

- during the first interview
- during the subsequent interviews in case a new person was added
- if "unknown" in the question 2.250 – asked again in the next interview

2.250 Does anyone of those who live in the dwelling have any health problem, of physical or mental nature, interferes with your day-to-day functioning and has been lasting for six months or more (not including learning disability)?

1. Yes – Continue to question 2.260
2. No - Go to 3.20

2.260 Among those people living in the dwelling, who has a health problem?

More than one answer is possible

Questions 2.261-2.267 are asked about each individual selected in 2.260

2.261 Do you have difficulty seeing, even if wearing glasses or contact lenses?

1. No, no difficulty
2. Yes, some difficulty
3. Yes, a lot of difficulty
4. Do not see at all

2.262 Do you have difficulty hearing, even if using hearing aid?

1. No, no difficulty
2. Yes, some difficulty
3. Yes, a lot of difficulty
4. Do not hear at all

2.263 Do you have difficulty walking or climbing stairs?

1. No, no difficulty
2. Yes, some difficulty
3. Yes, a lot of difficulty
4. Cannot do at all

2.264 Do you have difficulty in getting dressed or washing up?

1. No, no difficulty
2. Yes, some difficulty
3. Yes, a lot of difficulty
4. Cannot do at all

2.265 Do you have difficulty remembering or concentrating?

1. No, no difficulty
2. Yes, some difficulty
3. Yes, a lot of difficulty
4. Cannot do at all

2.266 Apart from those that have been mentioned above, do you have another problem that interferes with your day-to-day functioning?

1. Yes
2. No

2.267 Is the disability recognized by the National Insurance Institute of Israel ("Bituach Leumi")? (Interviewer: if not all the disabilities are recognized but only one, mark "yes")

1. Yes
2. No
3. Recognition in process

Details of educational and work on all people age 15 and over that living in the apartment

Education and participation in labour force

3.20 Did you attend or do you attend school?

- 1 Attended only in the past
 - 2 Attends at present
(including on vacation)
 - 3 Did not attend school at all
- } *Continue to
Question 3.30*
- *Skip to Question 4.00*

3.30. For how many years did you attend or have you been attending schools?

(including studies at university, yeshiva, in a course lasting at least one year, etc.) _____ (1-99)

3.40 What is the type of school last attended?

1. Primary school / intermediate school
(including Heder / Kutab)
 2. Secondary school - vocational/agricultural
track (incl. vocational yeshiva)
 3. Secondary school - general track
(incl. general secondary school yeshiva)
 4. Yeshiva ("Great") excl. secondary
school yeshiva
 5. Teacher training college
 6. Post-secondary school for
practical engineers and
technicians
 7. Other post-secondary school
(e.g. school for registered
nurses etc.)
 8. Academic institutions
 9. Other, specify _____
- } *Not
toward
academic
degree*

3.50. What is the highest diploma / degree that you received?

1. Primary school / intermediate school diploma
(incl. studied in secondary school but did not graduate)
2. Secondary school diploma – no matriculation
3. Secondary school diploma - matriculation
4. Post-secondary school diploma (non-academic track)
5. First academic degree (BA or similar degree)
6. Second academic degree (MA or similar degree, including
medical doctor)
7. Third academic degree (Ph.D. or similar degree)
8. Other diploma/degree (specify): _____
9. No diploma / degree

3.60. (Only male Jews asked, except for those who answered 4 in 3.40) Have you ever studied in yeshiva?

1. Yes – *Continue to question 3.70*
2. No – *Go to 4.00*

3.70. (Asked if 4 in 3.40 or 1 in 3.60) What type of yeshiva did you study or are you studying in?

1. Secondary school yeshiva ("Yeshiva tichonit")
2. "Yeshiva ktana"
3. "Yeshiva gvoha"
4. "Yeshiva gdola"
5. "Yeshivat hesder"
6. Kolel
7. Other, specify: _____

3.80. (Asked if 3-7 in 3.70) For how many years did you study or have you been studying in all the yeshivot?

_____ (1-99)

Interviewer: "I'm going to ask you some questions about last week."

4.00 Did you work last week?

(The week ending last Saturday. Do not include housewives' work at home or voluntary work)

- 1 Yes - *Skip to Question 4.50*
 - 2 In compulsory army service
 - 3 In permanent army
- } *Skip to*
Question 4.290.1
- 4 No – *Continue to Question 4.20*

4.20. Did you work for even one hour last week?

- 1 Yes - *skip to Column II, Question 4.50*
 - 2 No – *Continue to Question 4.30*
-

4.30. Do you have a job from which you were absent all of last week ?

- 1 Yes - *skip to column III, Question 4.100*
 - 2 No - *continue to Question 4.40*
 - 3 Promised job within 30 days – *Skip to Question 4.220*
-

4.40. Did you actively seek work in the last four weeks?

(which ended last Saturday)

- 1 Yes - *skip to Question 4.170*
 - 2 No - *skip to Question 4.260*
-

Persons who worked last week

4.50. How many hours do you usually work per week in all places of work including work overtime? XX

(including preparation hours of teachers and artists)

Maximum hours – 97

Work irregular hours – 98 - *Skip to Question 4.90*

4.60. Did you work fewer hours than usual last week, because of vacation, illness, reserve, army service, labour dispute, or for any other reason?

4.61. Yes - how many hours less? XX

Continue to Question 4.70

No - *Skip to Question 4.80*

4.70. What is the main reason that you worked fewer hours than usual last week?

1 Vacation (including studies, mourning, wedding, annual vacation, etc.)

2 Illness, accident (personal)

3 Illness of child or other family member

4 Festivals

5 Reserve army service

C. Do you continue to treat the questionnaire?

1. Yes
2. No

D. Comments _____

Date of data entry _____ Name of person who entered the data _____ Code of person who entered the data _____

CHAPTER E: CHANGES IN THE LABOUR FORCE SURVEY 2009

In 2009, a number of changes were made in the Labour Force Survey.

1. The definition of the civilian labour force characteristics was updated (definition of those who were temporarily absent from work);
2. A Transition was made to the 2008 Population Census estimates.

1. Updating of the Definition of the Civilian Labour Force Characteristics (Definition of Those who Were Temporarily Absent from Work)

In 2009, the definition of the civilian labour force characteristics was updated in accordance with international definitions. As a result, there was an increase in the group of those who are “temporarily absent from work” and at the same time a decline in the number of those who “do not participate in the civilian labour force” and who worked during 12 months preceding the survey.

Until 2009, a person was defined as temporarily absent from work if he was temporarily absent from his regular work during the entire determinant week. That group included absentees up to a month without payment, and absentees up to a year – with payment.

As of 2009, the definition of those who are “temporarily absent from work” includes persons who were temporarily absent from their regular work during the entire determinant week, and have a formal attachment to their workplace, meaning they are guaranteed to return to work with the same employer at the end of the period of absence. This definition includes absence from work up to a year without payment, as long as there is a formal attachment to the workplace.

Note: Since a question regarding a formal attachment to a workplace will be introduced only in the monthly labour force survey questionnaire, adjustments have been made under existing limitations at this point. Therefore, to the existing group of persons who were “temporarily absent from work,” were added those who were absent from work for 2–12 months without payment, did not seek work and were not defined as “discouraged workers.” Up to now, this group was included with those who do not participate in the civilian labour force. To facilitate a comparison between years, survey data for 2009 were processed again under the updated definition.

2. Transition to the 2008 Population Census Estimates

From 2009, population estimates for the survey were based on results from the 2008 Population Census. In order to enable a comparison and to assess the effects of the Census estimates, the survey data for 2009 were processed once again, after an adjustment to the new population estimates (based on the 2008 Population Census).

The tables below present the effect of the changes mentioned above:

- Following adjustments to the 2008 Population Census, the number of persons aged 15 and over rose by 73,600 (an increase of 1.4%).

- The number of males rose by 35,600 and the number of females – by 38,000 (Table 1).
- The Jewish population rose by approximately 53,000, and the Arab population – by approximately 18,000 persons.
- Population growth occurred almost in all age groups, and specifically in the age group 25–54, which is the prime working-age group of the civilian labour force (an increase of approximately 52,000 persons).
- The urban population rose by approximately 56,000, whereas the rural population rose by approximately 17,000 persons.
- Examining by district of residence, the largest increase occurred in the Tel Aviv District – approximately 41,000 persons (an increase of 4.3%).

Table 2 presents percentage changes in the civilian labour force characteristics estimates, when both the updated definition and the 2008 Population Census estimates are applied.

In general, the effect of the updated definition is stronger than the effect of the adjustments to the Census estimates among those who were temporarily absent from work and those who did not participate in the civilian labour force and worked during the 12 months preceding the survey.

Among those who participated in the civilian labour force, those who were employed, and those who did not participate in the civilian labour force, the effect of the updated definition is weaker than the effect of the adjustment to the Census estimates. The updated definition has no effect on employed persons classified by extent of work, on unemployed persons, and on those who did not participate in the civilian labour force and did not work at all during the 12 months preceding the survey.

- The civilian labour force population rose by approximately 58,000 persons (a rise of 1.9% if both the updated definition and the adjustment to the Census estimates are applied, and a rise of 1.6% if only the adjustment to the Census estimates is applied). The number of those who “did not participate in the civilian labour force” increased by approximately 16,000 (a rise of 0.7% if both the updated definition and the adjustment to the Census estimates are applied, and a rise of 1.1% if only the adjustment to the Census estimates is applied).
- When the updated definition is applied, the number of those who “were temporarily absent from work” increases by 5.1%, and when the adjustment to the Census estimates is applied, in addition, the number of those persons increases more, by 1.4%, to a total increase of approximately 12,000. At the same time, the number of those who did not participate in the civilian labour force and worked during the 12 months preceding the survey, declines by 6.3% when the updated definition is applied. The adjustment to the Census estimates increases slightly this group (by 0.9%),

and the total number drops by approximately 8,000 when both changes are applied.

- The increase in the number of those who “were temporarily absent from work” occurs mostly among females, probably because of a vacation without payment taken after the 14 weeks of maternity leave.
- The changes did not substantially affect the civilian labour force participation rate and the employment rate (a rise of 0.3 percentage points) as well as the unemployment rate (a decrease of 0.07 percentage points) (Table 3).

The impact of the two changes on household estimates (Table 4):

- The number of households in Israel increased by approximately 31,000 (an increase of 1.5%).
- The number of households with employed persons increased by approximately 24,000 (an increase of 1.5%); thereof, the number of households where all members are employed persons increased by approximately 19,000 (an increase of 2.8%).
- The number of households without employed persons increased by approximately 6,000 (an increase of 1.2%). The increase occurred mainly among households in which no member participated in the labour force.

(1) Based on the 2008 Population Census estimates and on updated definition of labour force characteristics.

Explanation of Seasonal Adjustment

As of 2012, the monthly series of the Labour Force Survey has been seasonally adjusted. In general, a procedure of seasonal adjustment can be performed on a series with original data of at least five years. Since the data of the monthly series, based on the new survey, began in January 2012, a special procedure of seasonal adjustment and trend estimation was performed, based on monthly original data. These data were computed from the data of the quarterly Labour Force Survey for the period beginning in January 2003 until September 2011, with the addition of original data from the monthly Labour Force Survey, from October 2011. In order to perform the procedure of seasonal adjustment and trend estimation on the data series without a "fracture" in definitions, the aforementioned data series was made to correlate with the characteristics of the entire labour force, in accordance with the definitions of the monthly Labour Force Survey.

Note that seasonally adjusted data are calculated by adjusting the original data for the influence of seasonality and festival and trading day effects. Trend data are estimated by removing the irregular influences (noise) from the seasonally adjusted data. The seasonally adjusted data and the trend are subject to revisions as they are calculated anew each month on the basis of additional original data (concurrent seasonal adjustment).

A detailed and updated explanation on the seasonal adjustment procedure and trend estimation is given in the publication "[Seasonal and prior adjustment factors for 2016, trends for 2012-2016](#)"(internet only, at the C.B.S.: "Classification and methods, statistical methods, time series").

EXPLANATORY NOTES

Area Covered by the Statistical Data

The statistical data relate to the economic territory of the State of Israel, unless otherwise stated.

A. The economic territory of a country (according to the definition of the OECD-SNA. For a detailed definition, see: OECD, Glossary of Statistical Terms): The economic territory of a country consists of the geographic territory administered by a government within which persons, goods and capital circulate freely.

The economic territory of the State of Israel: According to this definition, the economic territory of the State of Israel is as indicated in paragraph B below.

B. District and Sub-District:

The districts and sub-districts are defined according to the official administrative division of the State of Israel, which includes 6 districts and 15 sub-districts.

Including Israeli localities in the Judea and Samaria Area.

Special Symbols in the Tables

Blank space = Irrelevant due to the table's structure

- = No cases

.. = Unknown or not for publication

() = Data based on estimates, or data based on a small number of cases,
or data with a relative sampling error which is high

(1) Those usually working less than 35 hours per week, because they sought but did not find full-time or additional work.

(1) העובדים פחות מ-35 שעות בשבוע בדרך כלל, משום שחיפשו עבודה במשרה מלאה או נוספת אך לא מצאו.

(2) Percentages of all employed persons.

(2) אחוזים מתוך כלל המועסקים.
